1. GENERAL SPECIFICATIONS

Model No.: PFX5800/PFX6800/PFX7800/FA-X11/FA-X21/FA-X10/FA-X20

Items	Descriptions
Line connection	PSTN (Public Switched Telephone Network)
Compatibility	CCITT G3/G2
Communication system	Half-duplex
Transmission speed	*25sec aprox. (G3, Normal mode 9600 BPS)
Modem	9600/7200/4800/2400BPS Automatic shiftdown
Coding	MH
Resolution	G3: (H) 8 pels/mm (V) Normal 3.85 lines/mm Fine 7.7 lines/mm
	G2: (H) 8 pels/mm (V) 3.85 lines/mm
Scanning Method	Contact image sensor
Printing Method	Thermal transfer
Document size (W × L)	216mm × 600mm max. 100mm × 150mm min.
Thermal paper roll (W × L)	216mm × 30m
Effective scan width	205mm
Effective print width	208mm
Talk request	Yes
Local copy	Yes
Auto Document Feeder	No
Auto Paper Cutter	No
Page number print	Yes
Contrast	Automatic
Manual/Auto receive	Yes
Power supply	AC 220 – 240V, 50Hz (EUROPE) AC 100 – 120V, 60Hz (USA, JAPAN)
Power Consumption	Stand by: 15 Watts Operating: 130 Watts max.
Size (W × D × H)	310mm × 278mm × 107mm
Weight	4.7Kg
Operating environment	Temperature +5 ~ +35° C Humidity 35% ~ 85% RH

*Transmission speed: With a Funai standard document without time for protocol signal i.e., CCITT phase C time only.

Model No.: PFX6800/PFX7800/FA-X21/FA-X20

Item	Description
Halftone	Yes, 16 levels
LCD display	16 digits, 1 line
One touch dialing	10 locations (32 digits)
Abbreviated dialing	50 locations (16 digits)
Redial	Yes
Journal print	Yes (40 reports max.)
Transmit Terminal ID	Yes (20 digits)
Clock & calendar	Yes

NOTE : ROM SEAL REFER

DISASSEMBLY INSTRUCTIONS

Precautionary instructions – Please read the following instructions carefully before proceeding.

1. Turn the power switch off and disconnect the power and telephone line cord.
2. Some electronic components are extremely susceptible to static damage.
Use the anti-static discharge tools when working with the printed circuit boards.
3. Do not use excessive force to remove circuit boards or connectors.

1. BOTTOM CHASSIS REMOVAL

Remove screws L-19, L-7 and L-8.

2. MAIN PCB ASS'Y AND POWER SUPPLY UNIT REMOVAL

2-1. For removal of Main PCB, remove screws L-8 and unfasten PCB hinges.

2-2. Screws must be removed in numeral order ①~⑦.

3. TOP CABINET ASS'Y REMOVAL

For removal of top cabinet Ass'y, remove screws ①~④, and pull the cover open lever as shown in ⑤. Then pull up the hinge bracket portions of top cabinet.

4. DOCUMENT GUIDE OUT (1), UPPER CHASSIS ASS'Y REMOVAL

For removal of upper chassis Ass'y, remove the document guide out (1) and slide the upper chassis toward rear side. Screws must be removed in numeral order ①~⑨.

5. THERMAL PRINT HEAD ASS'Y REMOVAL

For removal of thermal print head Ass'y, remove screws ①~③ and remove the Paper guide. Push down the thermal print head Ass'y and then slide it toward rear side so that ⑤ portion will be dislocated from the upper chassis ④.

6. IMAGE SENSOR ASS'Y REMOVAL

6-1. Remove E-ring and screw ①.

6-2. For removal of image sensor Ass'y, dislocate sensor springs ③, ④ then remove ⑥ portion, slide ⑦ portion toward front side and dislocate ⑧ portion.

7. HINGE BRACKET ASS'Y REMOVAL

For removal of Hinge bracket Ass'y, remove screws L-5 and slide the hinge bracket toward rear side as shown in arrows.

8. ROLLER ASS'Y REMOVAL

Remove screws L-4, then dislocate roller Ass'y.

9. MOTOR BRACKET ASS'Y REMOVAL

Remove screws L-11 and dislocate the motor bracket Ass'y.

L-11

M3 × 8 Screws,

P-tight bind head

35	I/O	D0	Data Bus
36	I/O	D1	
37	I/O	D2	
38	I/O	D3	
39	I/O	D4	
40	I/O	D5	
41	I/O	D6	
42	—	NC	Unused
43	—	NC	
44	I/O	D7	Data Bus
45	—	RTS0	Unused
46	I	CTS0	Clear to send for asynchronous SCI channel 0
47	I	DCD0	Data carrier detect for asynchronous SCI channel 0
48	—	TXA0	Unused
49	I	RXA0	Receive data for asynchronous SCI channel 0
50	I	DREQ0	DMA request for channel 0

PIN.No.	I/O	Signal name	Description
51	—	NC	Unused
52	—	TXA1	
53	—	NC	
54	I	RXA1	Receive data for asynchronous SCI channel 0
55	—	TEND0	Unused
56	0	TXS	Transfer data for serial I/O port
57	I	RXS	Receive data for serial I/O port
58	I/O	CKS	Clock For Serial I/O port
59	I	DREQ1	DMA request for channel 1
60	—	TEND1	Unused
61	—	HALT	
62	—	NC	
63	—	NC	
64	—	REF	
65	0	IOE	I/O Enable
66	0	ME	Memory enable
67	0	E	Enable
68	—	DIR	Unused
69	0	WR	Write
70	0	RD	Read
71	0	0	System clock
72	I	VSS	Ground
73	I	VSS	
74	I	XTAL	Crystal resonator
75	—	NC	Unused
76	I	EXTAL	Crystal resonator
77	I	WAIT	Wait
78	—	BUSACK	Unused
79	I	BUSREQ	Bus request
80	I	RESET	Reset

2. ONE – CHIP MPU (IC2 : uPD7533GB723)

PIN.No.	Terminal designation	I/O	Description
1	P21	—	NC
2	P73	O	Printer side stepping motor excitation phase output
3	P72	O	
4	P71	O	
5	P70	O	
6	P33	O	Image — signal request
7	P32	O	Read — out tone — shading mode setting
8	P31	O	
9	P30	O	
10	AVSS	—	GND
11	AN3	—	
12	AN2	—	
13	AN1	I	Thermal head thermister
14	AN0	—	GND
15	VAREF	I	Reference input (5V) for internal A/D converter

PIN.No.	Terminal designation	I/O	Description
16	NC	—	NC
17	VDD	—	Power Supply
18	P63	O	Reader side stepping motor excitation phase output
19	P62	O	
20	P61	O	
21	P60	O	
22	P13	—	NC (GND)
23	P12	I	Input for setting the thermal head rank
24	P11	I	
25	P10	I	
26	P03	I	Command input
27	P02	O	Command output
28	P01	I	Command sync clock
29	P00	I	Interrupt input
30	RESET	I	Reset input
31	DIVSEL	—	Power Supply

PIN.No.	Terminal designation	I/O	Description
32	CL1	I	Crystal resonator
33	NC	—	NC
34	CL2	I	Crystal resonator
35	P53	O	Decoder address signal for thermal head strobe
36	P52	O	
37	P51	O	
38	P50	O	

PIN.No.	Terminal designation	I/O	Description
39	VSS	—	GND
40	P43	O	Gate signal for thermal head strobe
41	P42	O	Affirmative response to command
42	P41	O	Distortion – correction start signal
43	P40	O	Page section
44	P22	O	Negative response to command

3. GATE – ARRAY (IC9 : uPD65024GF)

PIN.No.	I/O	Signal name	Description
1	I	A0	Address bus
2	I	A1	
3	I	A2	
4	I	A3	
5	I	A4	
6	I	A5	
7	I	A6	
8	I	A7	
9	I	A15	
10	I	A16	
11	I	A19	
12	I	RST	Power – ON reset input
13	O	RSTO	Reset output
14	O	WAT	MPU – wait output
15	—	GND	Ground
16	I/O	D00	Data bus
17	I/O	D01	
18	I/O	D02	

PIN.No.	I/O	Signal name	Description
19	I/O	D03	Data bus
20	I/O	D04	
21	I/O	D05	
22	I/O	D06	
23	I/O	D07	
24	I	S20	Transmission level attenuator dip switch input
25	I	S21	
26	I	S22	
27	I	S23	
28	I	S24	
29	I	S25	Unused : held at +5V
30	—	S26	
31	I	S27	Transmission level attenuator dip switch input
32	I	ST0	Mode – set dip switch input
33	I	ST1	
34	I	ST2	
35	I	ST3	

PIN.No.	I/O	Signal name	Description
36	O	BUZZ	Buzzer signal output
37	O	LCDS	LCD signal output
38	O	MODS	Modem select signal
39	O	OPTS	Chip select baud rate device
40	—	GND	Ground
41	—	VDD	power supply
42	O	M _{RD}	Memory read signal (ROM, RAM)
43	O	M _{WR}	Memory write signal (RAM)
44	—	RAMX	Unused
45	O	RAM	RAM chip enable signal
46	—	ROMO	Unused
47	—	ROMT	Unused
48	I	VSD	Image sensor enable input
49	I	VSE	Image sensor data input
50	I	VSC	Image sensor clock input
51	I	MOD	Mode key input
52	I	VOR	Talk key input
53	—	PRN	Unused
54	—	STP	Unused
55	I	STA	Start/stop key input
56	I	TEST	Test terminal (usually used at LOW level)
57	I	CPUC	Clock input from MPU
58	I	ECK	Enable clock input from MPU
59	I	RTCS	8250 (clock IC) control signal
60	I/O	RTRW	Read/write control signal
61	I	RALE	Address latch enable
62	I	RT3	Address bus
63	I	RT2	
64	I	RT1	
65	I	RT0	
66	—	GND	Ground
67	O	LED0	LED output
68	O	LED1	LED output
69	O	LED2	LED output
70	O	LED3	LED output

PIN.No.	I/O	Signal name	Description
71	O	LED4	LED output
72	O	LED5	LED output
73	—	LED6	Unused
74	—	LED7	
75	—	VDD	Power supply
76	I	CSE	Cover sensor input
77	I	PSE	Paper-end sensor input
78	I	DSE	Document sensor input
79	I	AUT	Negative response input from one-chip MPU
80	I	I30	Power-supply thermal switch input
81	I	LP0	Loop current detection signal input
82	—	LP1	Unused
83	I	CAL	Ringer detection signal input
84	I	SBAK	Affirmative response input from one-chip MPU
85	O	SINT	Interrupt signal output to one-chip MPU
86	O	SUBR	Reset output to one-chip MPU
87	—	DTMF	Unused
88	O	CM _{LR}	RL2 relay switching signal output
89	O	THMR	Relay switching output for thermal head current
90	—	GND	Ground
91	—	VDD	Power supply
92	O	DR0	DMA request signal output to MPU
93	O	DR1	DMA request signal output to MPU
94	O	INT	Interrupt request signal output to MPU
95	O	SIN	Serial data output to thermal head
96	O	CLK	Clock output to thermal head
97	I	IOE	I/O enable signal input from MPU
98	I	ME	Memory enable signal input from MPU
99	I	R _D	Memory read signal input from MPU
100	I	W _R	Memory write signal input from MPU

CONNECTOR DESCRIPTION

Thermal head connector table | Image sensor connector table

(Signal side)

No.	Signal designation	No.	Signal designation
1	TM	10	STR T
2	TM (+5V)	11	DI
3	STR 8	12	CP
4	STR 7	13	CA
5	STR 6	14	BEO
6	STR 5	15	NC
7	STR 4		
8	STR 3		
9	STR 2		

(Power supply side)

No.	Signal designation	No.	Signal designation
1	VDD (+5V)	8	GND
2	GND	9	COM (+24V)
3	GND	10	COM (+24V)
4	GND	11	COM (+24V)
5	GND	12	COM (+24V)
6	GND	13	COM (+24V)
7	GND	14	COM (+24V)

(Signal side)

Terminal no.	Signal abbr.	Signal designation	I/O	Description
1	VIR	Image signal request	I	Pulse width $\geq 24.5 \times \text{VSC}$ (L: valid)
2	PGEN	Page section	I	L: transmission; H: transmission stop
3	MDS1	Tone-shading mode 1	I	Appended table 2
4	MDS2	Tone-shading mode 2	I	Appended table 2
5	MDS3	Tone-shading mode 3	I	Appended table 2
6	VSDA	Image signal	O	L: black; H: White
7	VSCK	Image signal clock	O	375kHz
8	VSEN	Image signal valid section	O	L: valid
9	SHST	Distortion-correction start signal	I	$\geq 2 \times \text{VSCK}$ (each page); L: Valid
10	CK8V	System clock	I	3MHz
11	NC		—	
12	-VSCK	Image signal clock	O	375kHz

(Power-supply side)

Terminal no.	Signal abbr.	Signal designation	Description
1	+12V	+12V (DC)	To +12V power supply
2	-12V	-12V (DC)	To -12V power supply
3	+5V	+5V (DC)	To +5V power supply
4	AG	Analog ground	One-point ground (power supply)
5	DG	Digital ground	
6	LEDP	LED (+12V)	To +12V power supply
7	LEDG	LED	Ground (power supply)

Power-supply unit connector table

Pin no.	Terminal designation

2. INSTALLATION PRE-CAUTIONS

- 1) Do not use in direct sunlight or in locations where dust accumulates (near air-conditioning outlet, etc.).
- 2) Avoid extremes of temperature and humidity.
temperature ; 5°C~35°C, humidity: 45%~85%.
- 3) Do not operate the unit on the same power line as equipment with an irregular current flow, e.g. motors in airconditioners, typewriters, copiers, etc.
- 4) Installing near by the T.V. Radio may occur interference. About 3 meters clearance are recommended.
- 5) Be sure to connect the ground for safety.
Caution: Never connect to gas or water piping.

3. MAINTENANCE

1) CLEANING

Preventative maintenance is a good habit to get into. This apparatus has been engineered to be exceptionally reliable. The simple steps outlined below, performed after every 6 rolls of paper use, will keep this apparatus operating like new.

CLEANING OF THERMAL PRINT HEAD AND PAPER GUIDE ROLLERS.

Thermal print head, paper guide rollers should be cleaned softly with a cotton swab or non-static soft cloth moistened with pure isopropyl alcohol.

2) THERMAL PAPER ROLL

- Store the recording paper in dry, cool and dark place to avoid high temperature, high humidity and direct sunlight.
- In case of storing the recording paper, do not open the packing paper of recording paper.
- Use only specified recording paper to obtain clear picture image.

Specified. Recording Paper: # 9B00001

Thermal paper
216mm (W) x 30m (L)
Max. diameter: 62mm (8.5" x 98")

1. GENERAL SPECIFICATIONS

Model No.: PFX5800/PFX6800/PFX7800/FA-X11/FA-X21/FA-X10/FA-X20

Items	Descriptions
Line connection	PSTN (Public Switched Telephone Network)
Compatibility	CCITT G3/G2
Communication system	Half-duplex
Transmission speed	*25sec approx. (G3, Normal mode 9600 BPS)
Modem	9600/7200/4800/2400BPS Automatic shiftdown
Coding	MH
Resolution	G3: (H) 8 pels/mm (V) Normal 3.85 lines/mm Fine 7.7 lines/mm
	G2: (H) 8 pels/mm (V) 3.85 lines/mm
Scanning Method	Contact image sensor
Printing Method	Thermal transfer
Document size (W × L)	216mm × 600mm max. 100mm × 150mm min.
Thermal paper roll (W × L)	216mm × 30m
Effective scan width	205mm
Effective print width	208mm
Talk request	Yes
Local copy	Yes
Auto Document Feeder	No
Auto Paper Cutter	No
Page number print	Yes
Contrast	Automatic
Manual/Auto receive	Yes
Power supply	AC 220 – 240V, 50Hz (EUROPE) AC 100 – 120V, 60Hz (USA, JAPAN)
Power Consumption	Stand by: 15 Watts Operating: 130 Watts max.
Size (W × D × H)	310mm × 278mm × 107mm
Weight	4.7Kg
Operating environment	Temperature +5 ~ +35° C Humidity 35% ~ 85% RH

*Transmission speed: With a Funai standard document without time for protocol signal i.e., CCITT phase C time only.

Model No.: PFX6800/PFX7800/FA-X21/FA-X20

Item	Description
Halftone	Yes, 16 levels
LCD display	16 digits, 1 line
One touch dialing	10 locations (32 digits)
Abbreviated dialing	50 locations (16 digits)
Redial	Yes
Journal print	Yes (40 reports max.)
Transmit Terminal ID	Yes (20 digits)
Clock & calendar	Yes

3) DOCUMENT CONDITIONS

This Facsimile machine will not operate correctly if the condition of the document to be copied or transmitted falls into any of the following categories:

* Cloth

* Wet or damp paper

* Ink or glue have not yet dried

* Paper worn out

* Metal sheet

* Laminate paper

* Printing paper

* Curled paper

* Surface is too smooth

* Any plastic tape on the paper

* Carbon paper

* Improper thickness (over 0.15mm or less than 0.05mm)

4. THEORY OF OPERATION

OUTLINE

This device, if divided into blocks according to functions, can be classified into the nine blocks below.

① MAIN MPU BLOCK

This block is composed of the main MPU (IC1), the PROM (IC5), and the RAM (IC6). The main control block regulates, directly or indirectly, the interface block, the modem block, the one-chip MPU block, the recording block, the read-out block, etc.

② INTERFACE BLOCK

This block is composed of custom gate array ICs (IC9 and IC11). The interface block is controlled by the main MPU; it functions as a relay unit to send command signals to the peripheral circuits, and to relay signals from the peripheral circuits to the main MPU.

③ ONE-CHIP MPU BLOCK

This block is composed of the one-chip MPU (IC2). The one-chip MPU controls the read-out sensor, the thermal-imprint head, the drive motors (M1 and M2), etc.

④ RECORDING BLOCK

This block is composed of the thermal-imprint head (UN4), a drive motor (M2), the motor driver IC (IC4), the thermal paper roll, and the sensor (PS101).

The recording block functions, by means of the thermal-imprint head, to imprint the image signals (sent by way of the interface block) onto the thermal paper.

⑤ READ-OUT BLOCK

This block is composed of the contact-image sensor (UN3), a drive motor (M1), the motor-drive IC (IC3), and the document sensor (PS102); it functions to send to the main control block, by way of the interface block, image data read out by the contact-image sensor.

⑥ OPERATION BLOCK

This block is composed of the buttons on the upper cabinet. These buttons are used by the operator.

⑦ MODEM BLOCK

The modem unit (UN2) conforms to the communication conditions prescribed in CCITT V29, V27 ter, T30, T4 and T3. The modem functions to modulate the data sent from the main MPU, and to transmit, via a telephone line, to the corresponding device. In addition, it demodulates data sent from the corresponding device, and transfers those data to the main MPU.

⑧ NCU (NETWORK CONTROL UNIT) BLOCK

The NCU block is composed of relays, the loop current-detection circuit, the ringer-signal-detection circuit, and the dial-signal-generation circuit (built-in telephone or external telephone). The NCU functions as the interface between the telephone line and the device, and also functions to control the telephone line side according to directions from the main MPU.

⑨ POWER-SUPPLY BLOCK

The power-supply block is composed of the power PCB, the power-inlet jack, and the power switch; it is unified by the shielded chassis (UN1). The power-supply unit functions to supply stabilized DC voltages (+5V, +12V, -12V and +24V) to each block of the device by AC 100 -120V, 60Hz (USA and Japan) or AC 220 -240V, 50Hz (Europe).

1) READ OUT SECTION

A contact image sensor is used as the optical system; the sensor section, amplifier, A/D conversion circuitry, image-processing circuitry, etc. are unified as a module. For activation, the binary-converted serial data (\overline{VSDA}) are synchronized to the clock pulse (\overline{VSCK}), by the clock pulse ($\overline{CK8V}$) and power supply, and are output.

The output data are input from the \overline{VSDA} terminal of IC9, and, when the internal serial-to-parallel conversion occurs, the data are read into the picture-image buffer as 8-bit data while at the same time there is a count check of each line (1, 728). The control of the tone-shading mode level setting and distortion-correction start is performed by the one-chip MPU (IC2).

READ OUT MECHANISM CONSTRUCTION

Tone-shading setting table

MDS3	MDS2	MDS1	Operation mode
L	L	H	Binary level 0
H	L	H	Binary level 1
L	L	L	Binary level 2
H	L	L	Binary level 3
L	H	L	Binary level 4
H	H	L	Binary level 5
L	H	H	Dither (normal)
H	H	H	Dither (sharp)

(Automatically set by one-chip MPU.)

↓
Dark

2) MECHANISM AND IMPRINT CONTROL SECTION

This circuitry is mainly composed of IC2 (one-chip MPU) and IC9 (gate array).

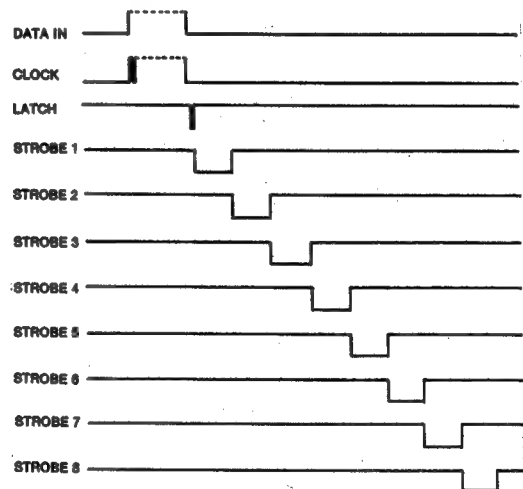

This one-chip MPU is a complete slave to the main MPU; it accepts commands from the main MPU transmitted by serial transmission, and executes the operations for those commands. If the operations for the commands are completely executed, the SUBACK signal is the response to the MPU; if for any reason the operations for the commands cannot be completely executed, the NAK signal (via IC9) is the response to the MPU. For control of the mechanism section, the reader side stepping motor and the printer side stepping motor are controlled, by way of the motor drivers (IC3 and IC4), so that document insertion and transport, recording paper transport, paper feed, etc. are performed.

The stepping motors used (at the both the reader side and the printer side) are 4-phase stepping motors. These motors are directly controlled (from the output port of the one-chip MPU) by the two-phase excitation method. For control of imprinting, almost all signals output to the thermal head are controlled; the image-signal data within the picture-image buffer are transferred at high speed from the SIN terminal of IC9 to the shift register within the thermal head, and, at the moment when the 1, 728-dot data are sent, the command is provided to the one-chip MPU from the main MPU, after which the one-chip MPU provides the STROBE signals to the thermal head, and the impression is made. In order to prevent dispersion of the density of the impression resulting from the temperature of the thermal head, IMPRINTING PERIOD, Resistance value of thermal head, the number of impression dots, etc., these parameters are input to the one-chip MPU so that the pulse-width of the STROBE signals is varied by the appropriate algorithm, thereby controlling the impression density.

IMPRINT MECHANISM CONSTRUCTION

Thermal head STROBE timing

3) MODEM SECTION

The functions described above are controlled by accessing of the interface registers (located within the modem) by the MPU (on the printed-circuit board) by way of the data bus. The principal items regulated by these registers are as described below.

Mode settings: V29, V27 ter, G2, FSK, tone transmission and reception. Equalizer's equalization system, carrier detection threshold, echo suppressor protect

Tone addition, transmission/reception mode setting, G2 AGC control, tone frequency setting

As a result of the reading of data from the registers by way of the data bus, the modem conditions (tone detection, training pattern detection, etc.) are monitored. For transmission, data transmitted from the CPU are assigned and modulated, and these are then provided from the transmission analog output to the NCU section. For reception, the reception analog signals provided from the NCU section pass through the filter circuit; then, after being demodulated at the modem, they are read in to the MPU.

Tone transmission and detection

Transmission mode	Transmission speed	Modulation system	Modulation speed	Carrier frequency	CCITT recommendation
G3	9600BPS	Hexadecimal QAM	2400baud	1700Hz	V29
G3	7200BPS	Octal QAM	2400band	1700Hz	V29
G3	4800BPS	8-phase PSK	1600baud	1800Hz	V27ter
G3	2400BPS	4-phase PSK	1200baud	1800Hz	V27ter
G3	300BPS	FSK	300baud	1650/1850Hz	V21
G2		AM-PM-VSB		2100Hz	T3

Signal designation	Frequency
CED	2100Hz
GI	1850Hz
GC	2100Hz
CFR	1650Hz
MCF	1650Hz
LCS	1100Hz
EOM	1100Hz
PIS	462Hz

[illegible]

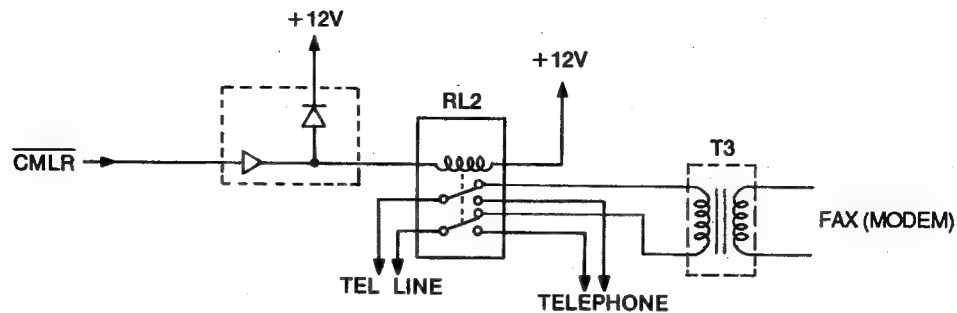

The DC resistance of transformer and the DC resistance of the off-hook detection circuit (DC circuit) is designed in accordance with PTT requirements; in addition, the nominal impedance is 600 ohms at 0.3 - 4kHz.

The off-hook detection circuit is composed of lead relay RL3 (in series with telephone receiver) as well as C10 and VD1. When there is a off-hook, A2 and B2 are connected, and there is detection as a result of the flow of direct current to the coil part of the lead relay, thus switching the relay ON. C10 is inserted in order to suppress momentary pauses and momentary power interruptions during telephone use.

The ring detection circuit is composed of C13 as well as D1, ZD3, and PC2 (all in parallel with the telephone circuit); when the ring signal (15 - 58Hz) is input, the direct-current component (DC 55 - 60V) is suppressed by C13, with the result that only the AC component is subjected to half-wave rectification by D1. After that, photo-coupler PC2 is switched ON, and the frequency is selected by the MPU in relation to the output signal. The ZD3 zener diode is for elimination of noise.

4-4) CML circuit

When there has been an automatic reception response or the facsimile button has been pressed, RL2 (Relay) is activated by the CMLR signal "ON" (0V) from IC9, thus closing and connecting the DC loop. As a result, the telephone line is switched to the facsimile side (modem).

4-5) Surge absorbers

The surge absorbers are provided in order to prevent damage to the NCU circuit section as a result of surge voltage produced between telephone lines; SA1 is used between La and ground, and ZR1 is used between La and Lb.

5) SENSOR CIRCUITS

5-1) Paper-end sensor circuit

A reflection-type photo-sensor is employed for detection of the paper end; when there is detection of the paper black band (paper-end marking), or there is no recording paper, the photo-sensor (PS101) is switched OFF, and PSE of IC9 changes from 0V to 5V, thus resulting in the detection.

5-2) Document sensor circuit

A photo-interruptor is employed for detection of the document; when the document is inserted, the photo-interruptor (PS102) is switched OFF; and DSE of IC9 changes from 0.13V to 5V, thus resulting in the detection.

5-3) Cover sensor circuit

A microswitch is employed for detection of the opening of the cover; when the cover is opened, the microswitch (SW104) is switched OFF, and the detection is made as the result of the change (from 0V to 5V) of the CSE of IC9.

6) POWER-SUPPLY UNIT

This power-supply unit has an input voltage of AC 85 - 138V (USA, JAPAN) or AC 198 - 264V (Europe), and five outputs: +24V (1.52A), +5V (1.0A), +12V (0.8A), -12V (0.09A), and TH (thermal switch terminal). The TH (thermal switch terminal) is usually ON (GND); when, however, the temperature of the unit rises to approximately 80°C, TH is switched OFF (OPEN), and the unit's temperature status is detected by the MPU.

This power-supply unit incorporates an overcurrent protection circuit; if the rated output current is exceeded and the activation current value is reached, the output is caused to drop.

Connector connections

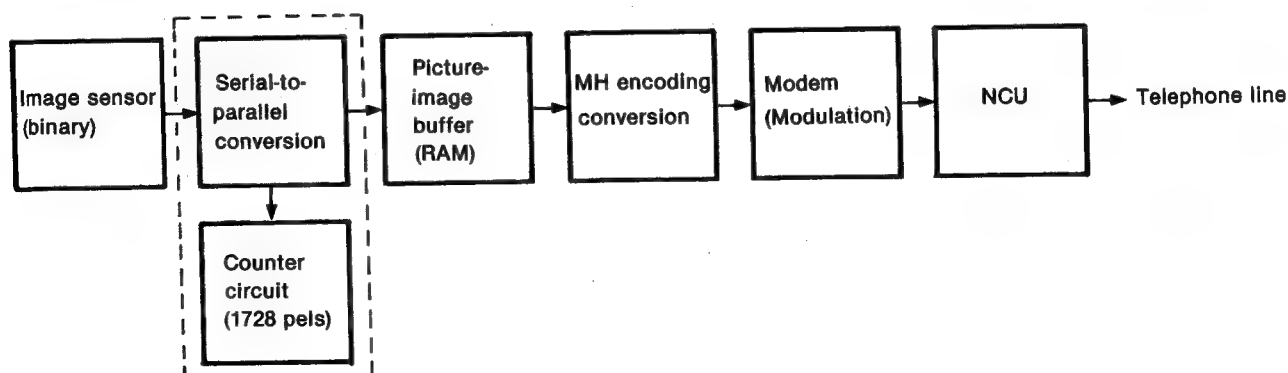

Pin no.	Terminal designation
1	TH
2	+5V
3	DGND
4	DGND
5	-12V
6	AGND
7	+12V
8	+24V
9	+24V
10	+24V
11	+24V
12	PGND
13	PGND
14	PGND
15	PGND

Overcurrent protection circuit activation current values

Output	Protection circuit activation current
+5V	1.2A or higher
+24V	7.6A or higher (pulse load)
+12V	1.2A or higher
-12V	0.3A or higher

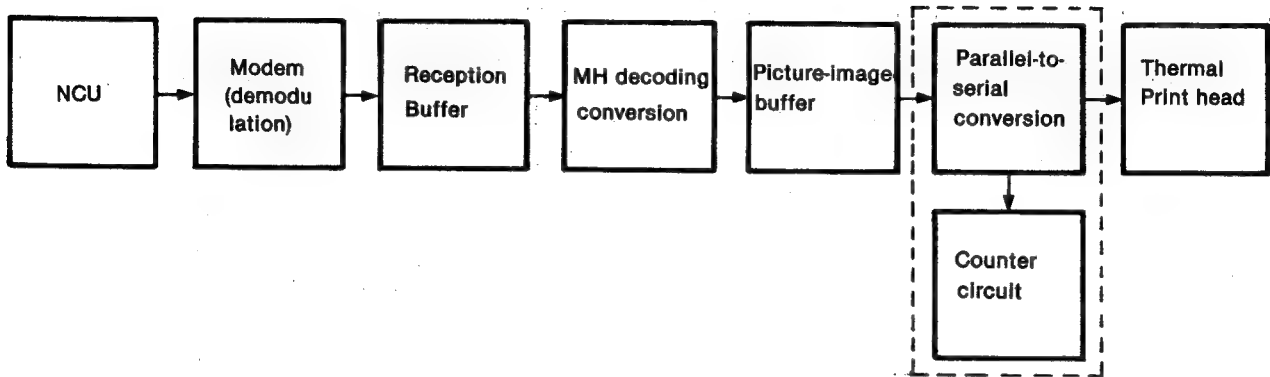

7) TRANSMISSION PROCEDURE

With the document inserted, if the "START" button depressed is recognized by the MPU (IC1) and at that time loop current is detected and LP0 of IC9 is HIGH level, the CMLR signal is generated from IC9 (gate array), the RL2 relay of the NCU circuit is switched ON, and the telephone line is connected with the facsimile (Modem). Since connection is established between apparatus operating in accordance with CCITT. Then, the MPU controls (through the modem) the command signals, and, when centering phase C (message transmission) stage, the MPU, as a result of serial transmission of the TXS and CKS signals, activates IC2 (a one-chip MPU); after the subsequent read-out by the image sensor, the converted-to-binary read-out signals are subjected to serial-to-parallel conversion at IC9, after which the signals are input (by the DMAC within the MPU) to the RAM's picture-image buffer. The input picture signals are MH-encoded by the MPU, after which they are modulated by the modem and input to the telephone line (TXL). All scanning picture datas of the document for transmission are transmitted one after another in this same way. (See Figure-1)

8) RECEPTION PROCEDURE

There are two methods of initiating the reception mode: manual and automatic. For either method, command signals are controlled by the MPU when the reception mode begins. When, thereafter, entering phase C (image reception) stage, the data from the modem are stored in the reception buffer (located within the RAM IC6). Thereafter, the data in the reception buffer are decoded (by MH decoder) and are reproduced on the picture-image buffer within the RAM (IC6). These reproduced signals are then subjected to parallel-to-serial conversion by IC9, and, after transfer to the thermal print head, they are imprinted upon thermal paper roll by the STROBE (1 - 8) signals controlled by IC2.

9) LOCAL COPYING PROCEDURE

When, with the document inserted, the START button depressed is recognized by the MPU, the MPU then issues commands for IC2 by serial START button depressed is recognized transmission of TXS and CKS signals, thus controls the image sensor and the motor, after which read-out is initiated. The read-out data are then input to IC9 (VSDA) as serial data. Simultaneous with the serial-to-parallel conversion within IC9, one line of read-out is completed at the moment when "1,728" is counted by the counter circuit. Subsequent read-outs are performed one after another, and the parallel-converted data are input as 8-bit data to the picture-image buffer (IC6). The data input to the picture-image buffer are then subsequently subjected to parallel-to-serial conversion one after another by IC9 and output from SIN of IC9. When the START button depressed is then detected at the MPU, the $\overline{\text{THMR}}$ signal of IC9 is changed to LOW level, and when the PL1 relay is then switched ON, 24V is supplied to the thermal head power-supply terminal. The serial data output from IC9 are input to the thermal head, and, at the moment that the data corresponding to one line (1,728 dots) are input, that line is caused to be imprinted by the STROBE signals from the one-chip MPU. In this way, therefore, data from the picture-image buffer are line by line imprinted one after another.

5. ALIGNMENT PROCEDURE

1) TIMER SETTING ADJUSTMENT

1-1) Contact the probe of quartz timer onto Main PCB as described.

1-2) Adjust TC1 to set 0.8~1.2 sec/day reading on quartz timer at 25°C.

2) PAPER-END SENSOR ADJUSTMENT

2-1) Place a cap (White) on sensor-unit.

2-3) Place a cap (Black) on sensor unit and LED (B) light on.

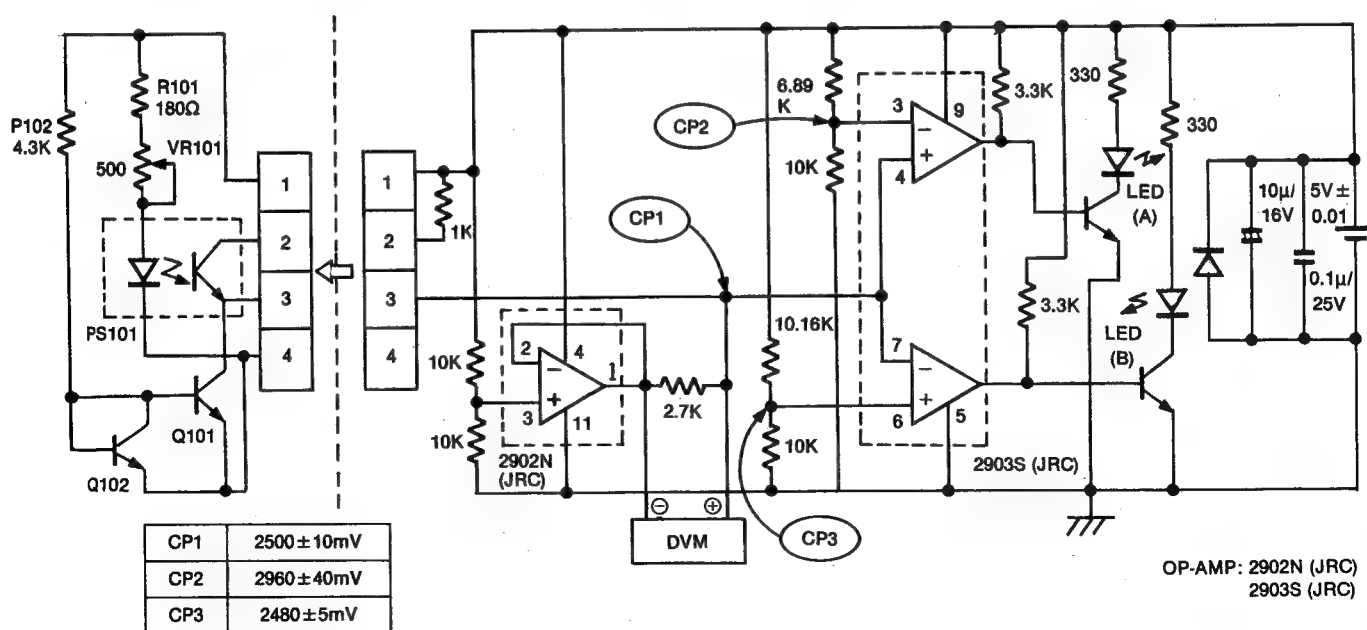

2-2) Adjust VR101 to set $520 \pm 20\text{mV}$ reading on DVM.
Confirm that LED (A) light on.

	LED (A)	LED (B)
White cap	Light on	Light off
Black cap	Light off	Light on

(PAPER-END SENSOR PCB)

(Fixture for adjustment)

* 4 pin connector must be opened.

6. DIP-SWITCHES SETTING INSTRUCTIONS

1) DIP-SWITCHES LOCATIONS/DESCRIPTIONS

There are two kinds of main PCB as described below;

Type-A : Incorporated with Matsushita's Modem.

Type-B : Incorporated with Rockwell's Modem.

For setting switches properly, carefully check the below locations and descriptions instruction.

TYPE-A (WITH MATSUSHITA MODEM)

1. DS1(Dip sw 1 : 4 bits)

SW No.	Description of parameters	Setting		Explanation
		OFF	ON	
1	Transmit level attenuator	0dB	1dB	ON : Transmit level down 1dB
2	Transmit level attenuator	0dB	2dB	ON : Transmit level down 2dB
3	Transmit level attenuator	0dB	4dB	ON : Transmit level down 4dB
4	Transmit level attenuator	0dB	8dB	ON : Transmit level down 8dB

2. DS2(Dip sw 2 : 8 bits)

SW No.	Description of parameters	Setting		Explanation
		OFF	ON	
1	Reception amplitude equalizer — 4dB	0dB	4dB	ON : Frequency response at 1.5k Hz will be amplified 4 dB.
2	Reception amplitude equalizer — 8dB	0dB	8dB	ON : Frequency response at 1.5k Hz will be amplified 8 dB.
3	Transmission amplitude equalizer — 8dB	0dB	8dB	ON : Frequency response at 1.5k Hz will be amplified 8 dB.
4	Communication speed 9600/4800 bps.	9600 bps	4800 bps	For manual selection of communication speed in case of bad connection of telephone line.
5	CED frequency setting 2100 Hz/1100 Hz.	2100 Hz	1100 Hz	Select CED frequency on receiving mode. Normally, set OFF position.
6	Test 1.	—	Test	Use for production test at factory.
7	Test 2.	—	Test	
8	Back up Batt. switch.	OFF	ON	Back up the memory of ID.

3. DS3(Dip sw 3 : 3 bits)

SW No.	Description of parameters	Setting		Explanation
		OFF	ON	
1	Adjustment for thermal head.	—	—	Setting only at factory.
2	Adjustment for thermal head.	—	—	Setting only at factory.
3	Adjustment for thermal head.	—	—	Setting only at factory.

(REAR SIDE)

TYPE-B (WITH ROCKWELL MODEM)

1. DS1(Dip sw 1 : 6 bits)

SW No.	Description of parameters	Setting		Explanation
		OFF	ON	
1	Back up Batt. switch.	OFF	ON	Back up the memory of ID.
2	Communication speed 9600/4800 bps.	9600 bps	4800 bps	For manual selection of communication speed in case of bad connection of telephone line.
3	Test 1.	—	Test	Use for production test at factory.
4	Test 2.	—	Test	
5	Cab. type selection	—	ON	Setting only at factory.
6	C.I.S. type selection	OFF	—	Setting only a factory.

2. DS2(Dip sw 2 : 8 bits)

SW No.	Description of parameters	Setting		Explanation

2	Adjustment for thermal head.	—	—	Setting only at factory.
3	Adjustment for thermal head.	—	—	Setting only at factory.

(REAR SIDE)

2) THERMAL PRINT HEAD ALIGNMENT

There are existing two type of Thermal head.

- 1) ROHM. type.
- 2) NEC. type.

When replace the thermal head, re-align the Dip-switch (DS3) as described below tables for each thermal heads. Either ROHM or NEC are indicated on every thermal head.

1) ROHM type

THERMAL HEAD RANK/DS3 SETTING TABLE

Rank No.	SW. 1	SW. 2	SW. 3	Thermal head resistance (ohms)
D	OFF	OFF	ON	1026~1105
E	ON	ON	OFF	986~1035
F	OFF	ON	OFF	946~ 995
G	ON	OFF	OFF	895~ 955

To keep good printing quality, proper switch (DS3) setting have to be done.

Note: Thermal head rank or resistance is indicated on each thermal head.

2) NEC type

THERMAL HEAD RANK/DS3 SETTING TABLE

Rank No.	SW. 3	SW. 2	SW. 1	Thermal head resistance (ohms)
1	ON	ON	ON	1288~1246
2	ON	ON	OFF	1245~1204
3	ON	OFF	ON	1203~1162
4	ON	OFF	OFF	1161~1120
5	OFF	ON	ON	1119~1078
6	OFF	ON	OFF	1077~1036
7	OFF	OFF	ON	1035~ 994
8	OFF	OFF	OFF	993~ 952

3) TEST MODES PROCEDURES

This test modes functions are usually used at factory for test purposes.

There are existing two kind of test modes.

- A) Fax test mode.
- B) Dial test mode (German version only).

A) Fax test mode procedure

1. Set Test 1 and Test 2 bits (see switch description on page 14.) as below.

(TYPE-A)

DS2	SETTING
TEST 1 (SW. No. 6)	ON
TEST 2 (SW. No. 7)	OFF

* Modem: Matsushita

(TYPE-B)

DS1	SETTING
TEST 1 (SW. No. 3)	ON
TEST 2 (SW. No. 4)	OFF

* Modem: Rockwell

2. Then, turn the power on.
Now, Fax test mode 1 is set when the power is turned on.
3. To select the Fax test mode 1 to 4.
Depress the Mode button to change Fax test modes.

4. Description of Fax Test Modes.

FAX TEST MODE 1

This mode 1 is used for life ageing test purpose. Apparatus will start copying function continuously with 1cm/1hour. Apparatus will stop copying when the recording paper is run out or depress the MODE button.

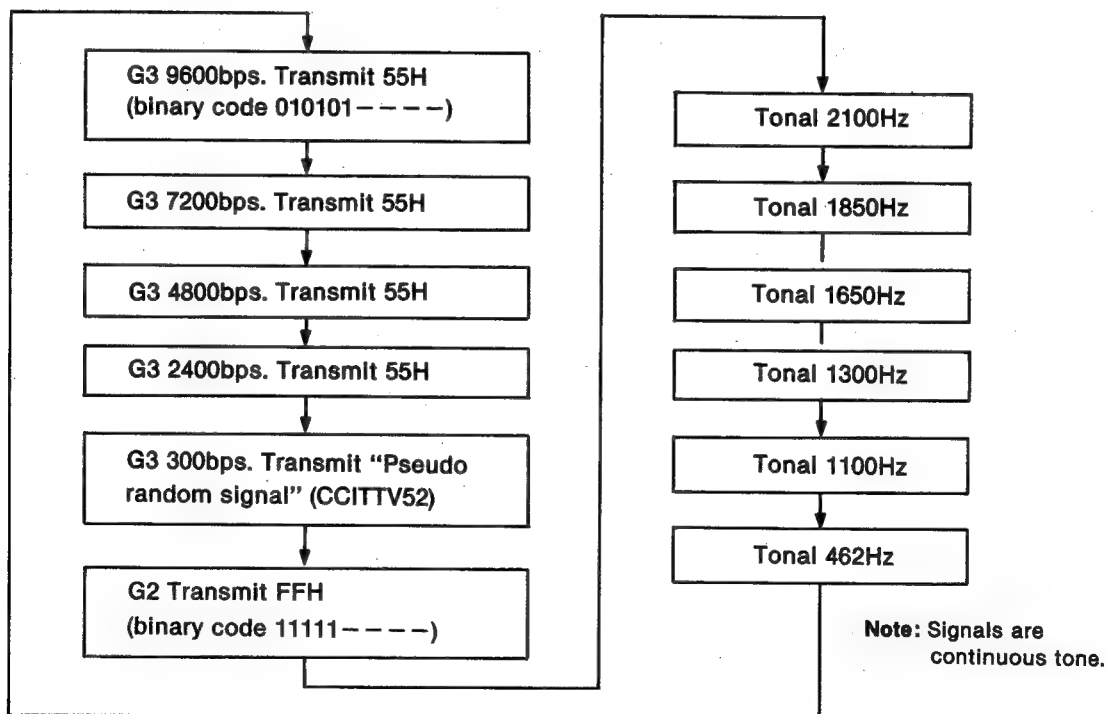

FAX TEST MODE 2

The relay (RL2) on N.C.U circuit will be switched over to facsimile side (Modem side) from telephone side.

FAX TEST MODE 3

Tel-line will be connected to facsimile side (RL2) and signals described as below are transmitted to the Tel-line. Depress the START button to change the signal.

FAX TEST MODE 4

This mode 4 is identical with mode 3 except transmitting signals (each signal will be transmitted for 3 sec periods) are changed automatically without depressing START button.

B) Dial test mode procedure (German version of PFX 6800 only)

1. Set Tset 1 and Test 2 bits (See switch description on page 14.) as below.

(TYPE-A)

DS2	Setting
Test 1 (SW. No. 6)	ON
Test 2 (SW. No. 7)	OFF

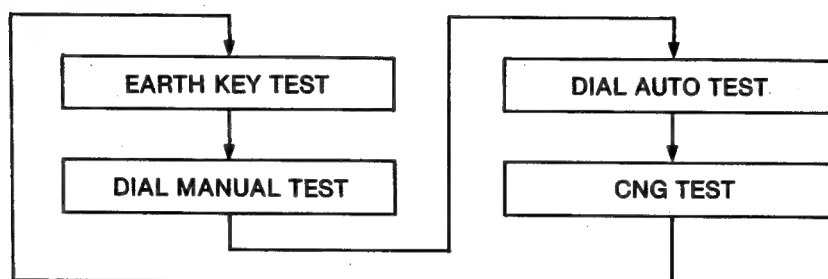

* Modem: Matsushita

(TYPE-B)

DS1	Setting
Test 1 (SW. No. 3)	ON
Test 2 (SW. No. 4)	OFF

* Modem: Rockwell

2. Then, turn the power on with the MODE button is depressed. Now, Dial test mode is set and select the dial test mode by depressing the MODE button.

3. Description of Dial test modes.

EARTH KEY TEST

EARTH KEY function will be activated for 300 msec when depress **#** button.

DIAL MANUAL TEST

Dialing signal will be transmitted to the telephone line when depress dialing buttons (**1**~**0**, *****, **#**, **PAUSE**).

Note: *****, **#** keys do not function in pulse dial mode.

DIAL AUTO TEST

Dialing signals (pulse or tone) will be transmitted automatically to the telephone line in numeral order as shown in below.

1 2 3 4 5 6 7 8 9 * 0 # PAUSE 1-----

output in order without depressing keys.

Note: *****, **#** Keys do not function in pulse dial mode.

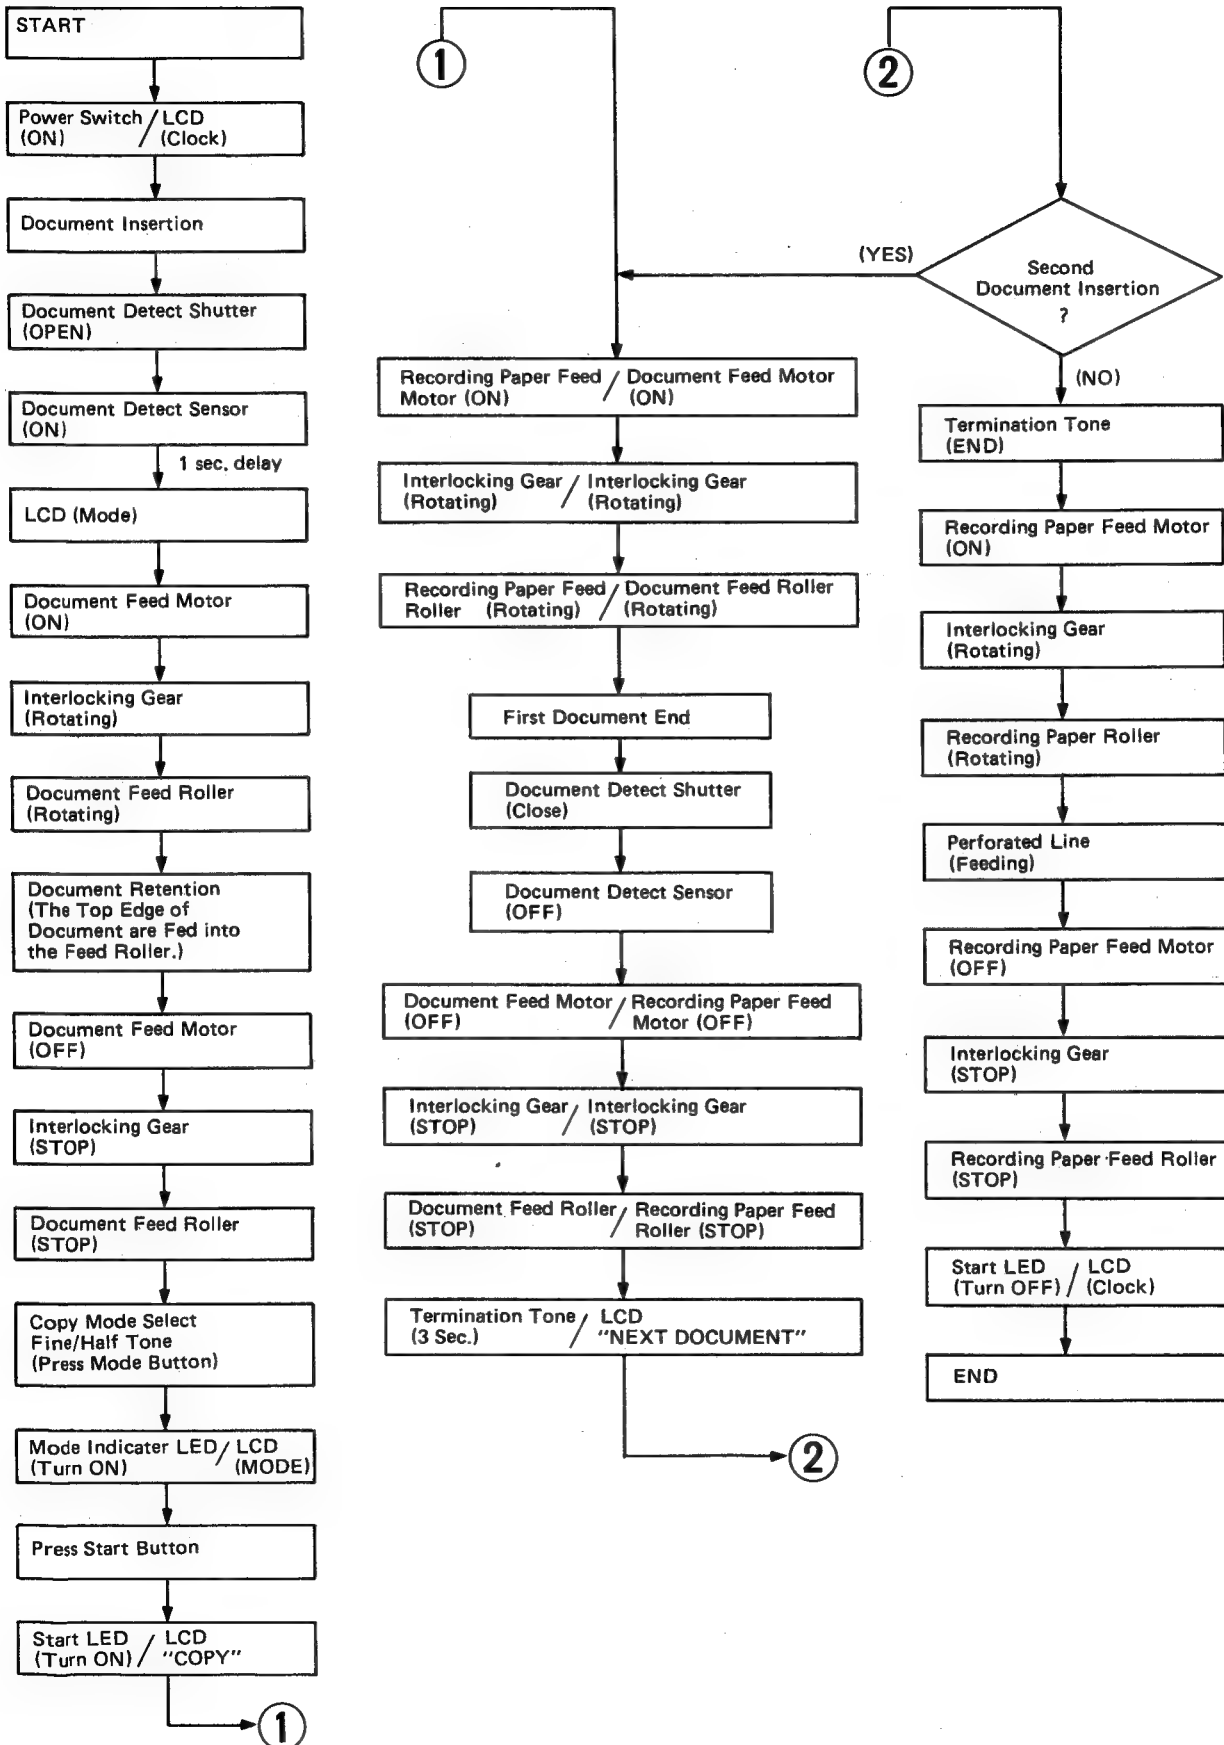

CNG TEST

CNG (1100Hz) tone will be transmitted continuously to the telephone line.

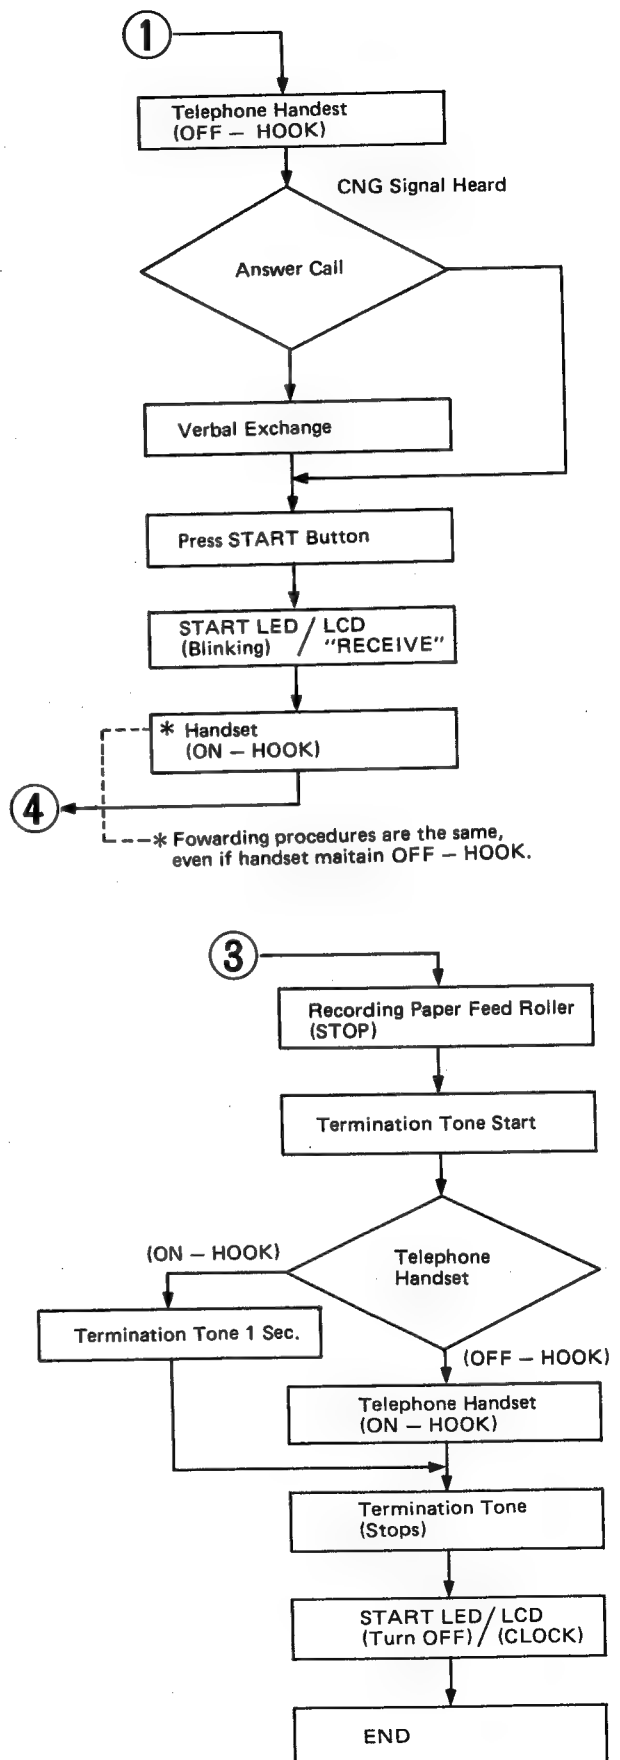

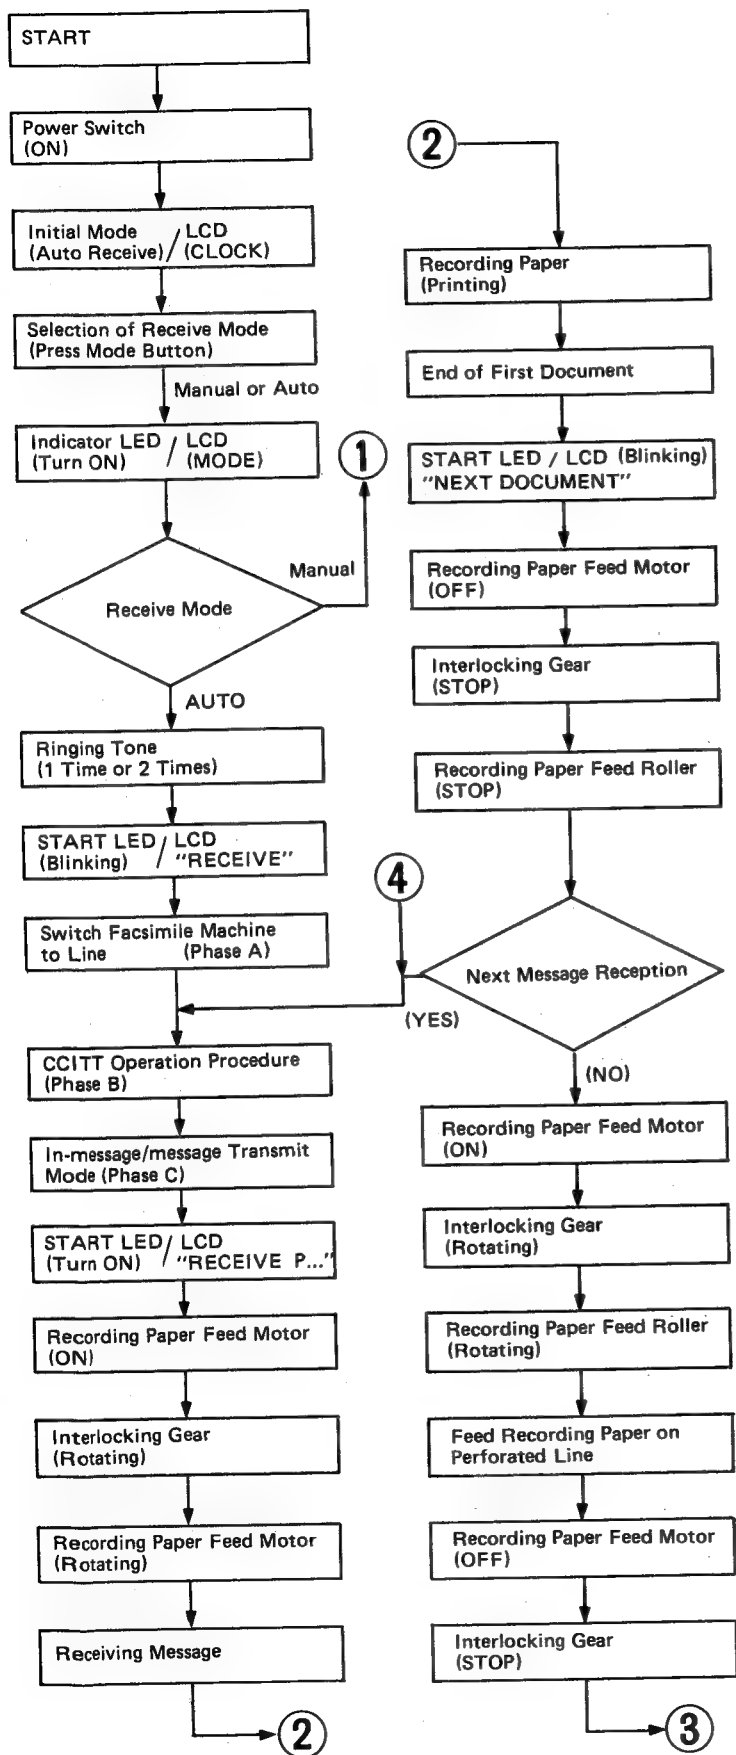

7. FLOW DIAGRAMS

1) OPERATION FLOW DIAGRAMS

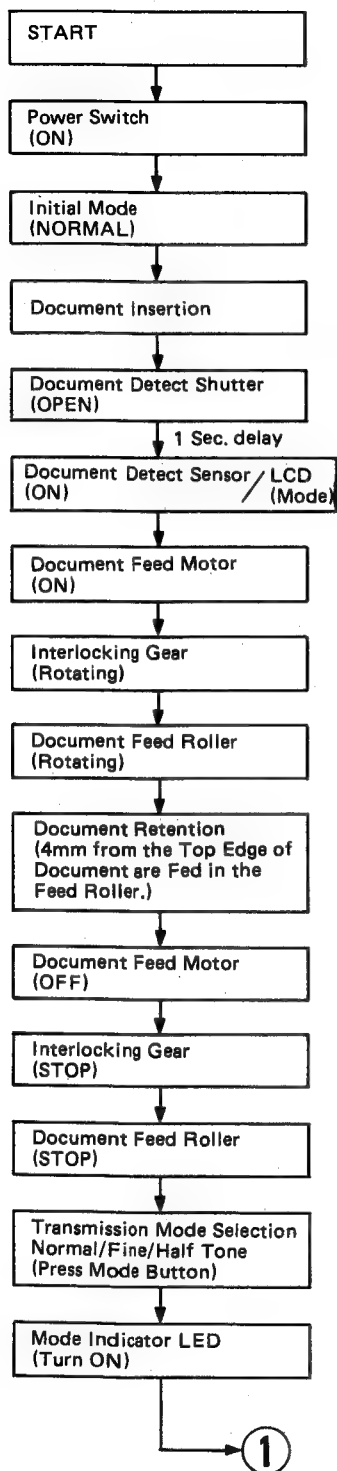

1-1) Copying mode

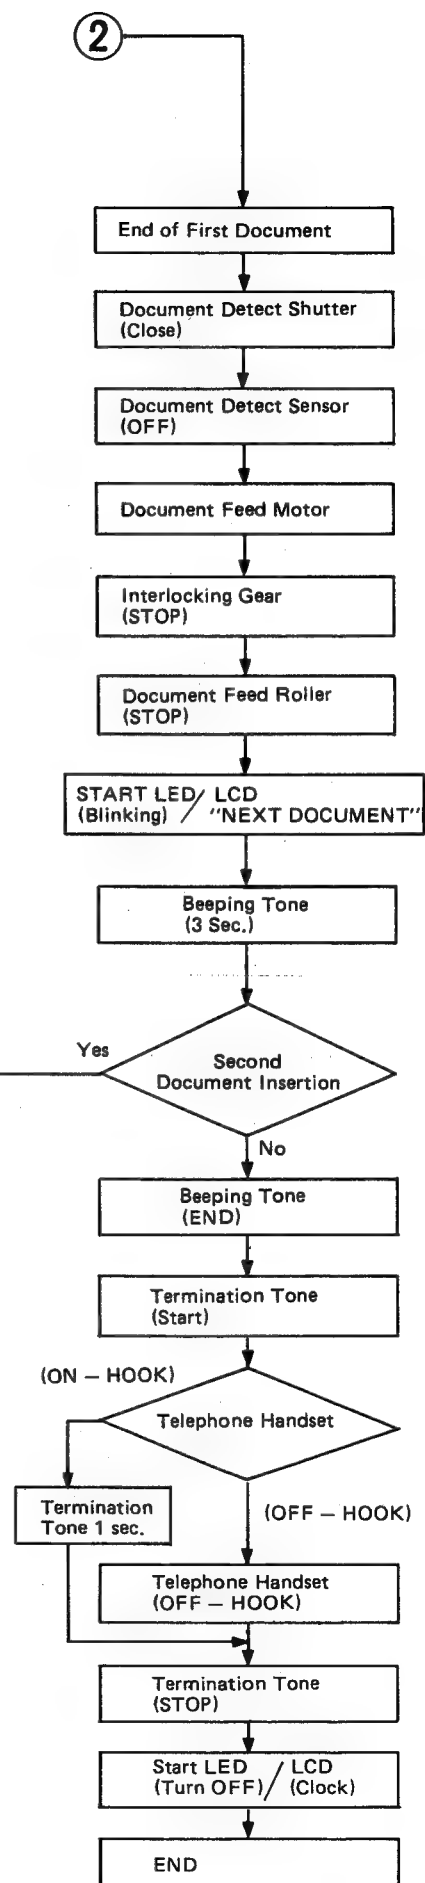

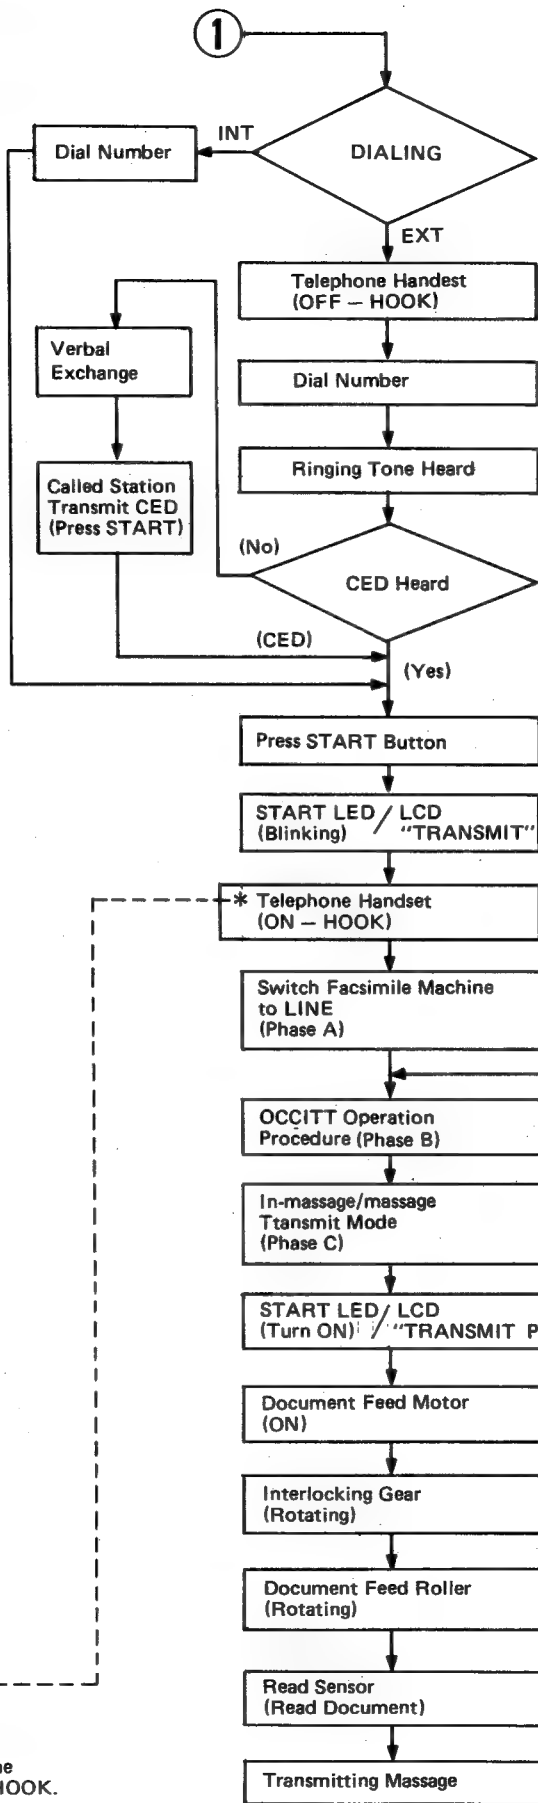

1-2) Reception mode

1-3) Transmission mode

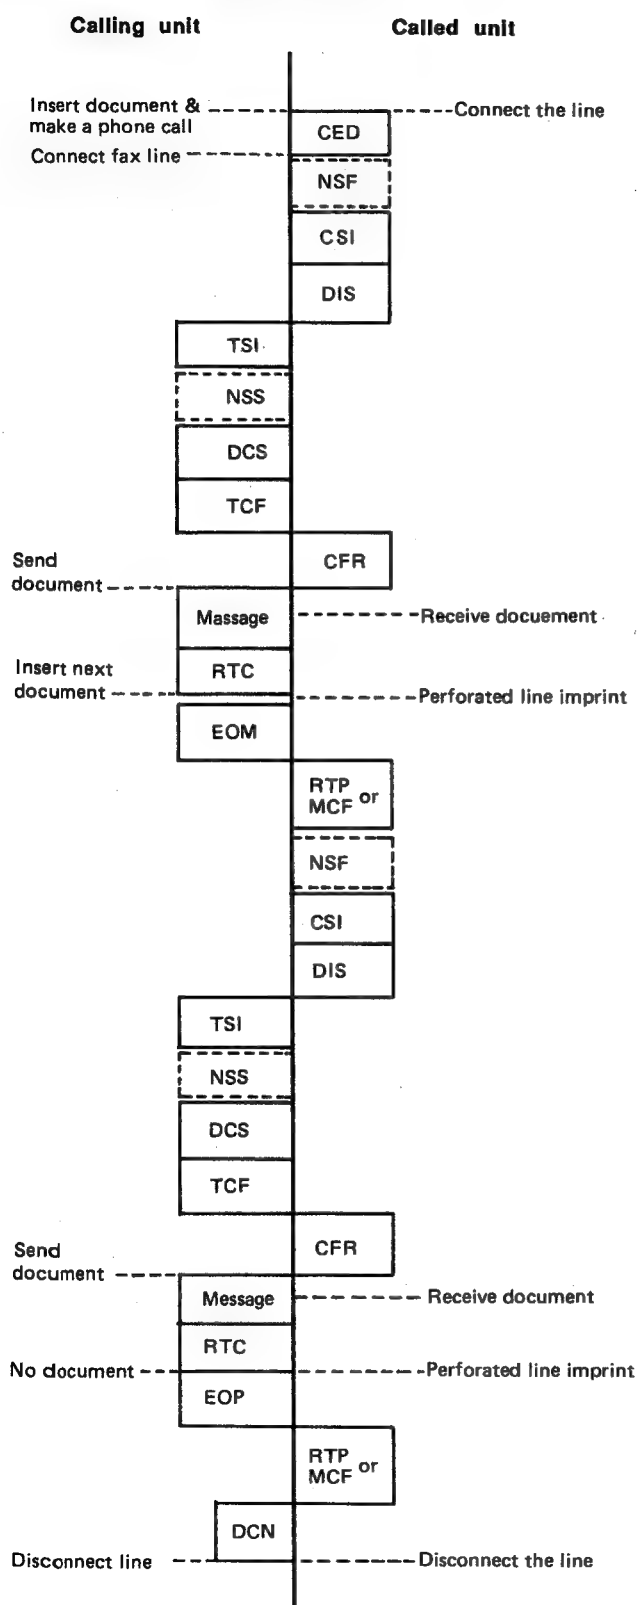

* Forwarding procedures are the same even if handset maintain OFF – HOOK.

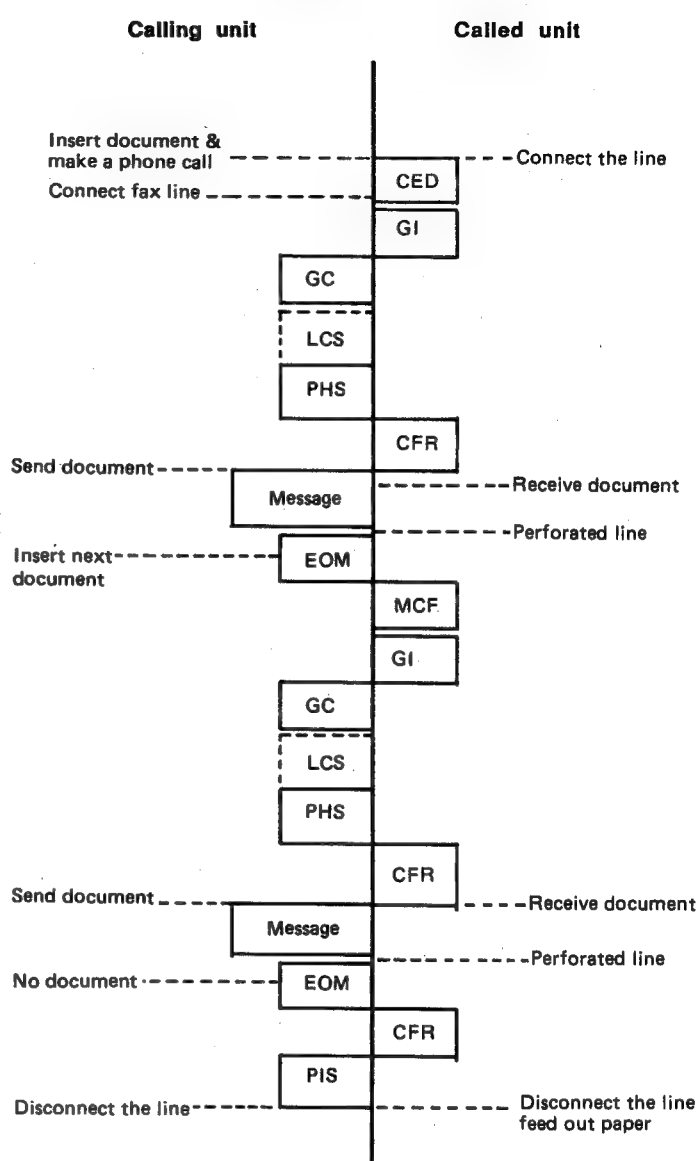

2) CCITT group 2/group 3 protocol

Group 3 protocol procedure

Group 2 protocol procedure

 Non-standard signal

3) INDEX OF ABBREVIATIONS

3-1) Index of abbreviations used in Group 3 (CCITT)

Abbreviation	Function	Signal format
CED	Called station identification	2100Hz
CFR	Confirmation to receive	X010 0001 1850 or 1650Hz for 3 s
CRP	Command repeat	X101 1000
CIG	Calling subscriber identification	1000 0010
CNG	Calling tone	1100 Hz for 500 ms
CSI	Called subscriber identification	0000 0010
DCN	Disconnect	X101 1111
DCS	Digital command signal	X100 0001
DIS	Digital identification signal	0000 0001
DTC	Digital transmit command	1000 0001
EOM	End of message	X111 0001 1100Hz
EOP	End of procedure	X111 0100
FCF	Facsimile control field	—
FIF	Facsimile information field	—
FTT	Failure to train	X010 0010
GC	Group command	1300Hz for 1.5–10.0s 2100Hz for 1.5–10.0s
GI	Group identification	1650 or 1850Hz
HDLC	High-level data link control	—
LCS	Line conditioning signals	1100Hz
MCF	Message confirmation	X011 0001 1650 or 1850 Hz
MPS	Multi-page signal	X111 0010
NSC	Non-standard facilities command	1000 0100
NSF	Non-standard facilities	0000 0100
NSS	Non-standard set-up	X100 0100
PIN	Procedural interrupt negative	X011 0100
PIP	Procedural interrupt positive	X011 0101
PIS	Procedure interrupt signal	462Hz for 3s
PRI-EOM	Procedure interrupt-EOM	X111 1001
PRI-EOP	Procedure interrupt-EOP	X111 1100
PRI-MPS	Procedure interrupt-MPS	X111 1010
RTN	Retrain negative	X011 0010
RTP	Retrain positive	X011 0011
TCF	Training check	Zeros for 1.5s
TSI	Transmitting subscriber identification	X100 0010

3-2) Index of abbreviations used in Group 2 (CCITT)

Abbreviation	Function	Freq. (Hz)	Timing (sec.)
CED	Called station identification	2100Hz ± 15	
CFR2	Confirmation to receive group 2	1650Hz ± 6	
CNG	Calling tone	1100Hz ± 38	
EOM	End of message	1100Hz ± 38	
GC2	Group 2 command	2100Hz ± 10	
GI2	Group 2 identification	1850Hz ± 6	
GI 1/2	Group 1/2 identification	1650Hz ± 6 1850Hz ± 6	
LCS	Line conditioning signal	1100Hz ± 50	
MCF 2	Message confirmation group 2	1650Hz ± 6	Same as CFR2
PIS	Procedure interrupt signal	462Hz ± 1.5	

8. TROUBLESHOOTING INSTRUCTIONS

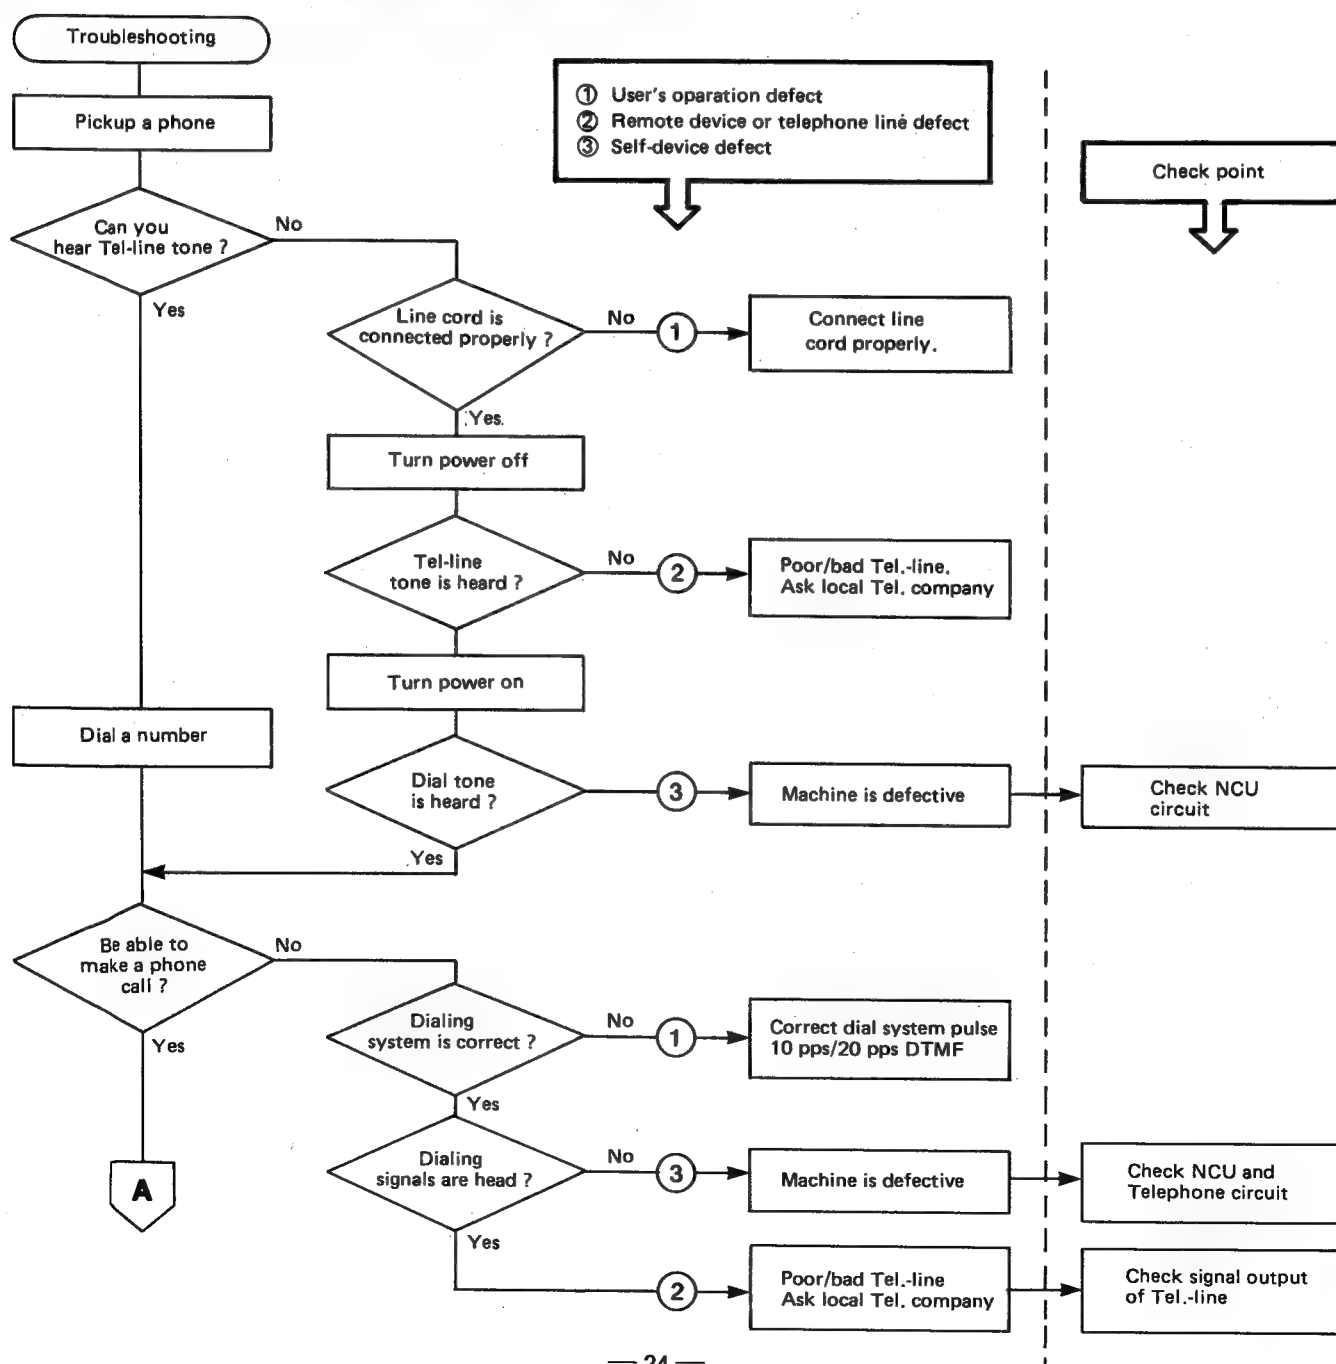

In order to rapidly diagnose the cause of a problem encountered during use of the unit, the cause should first be classified as one of the following three.

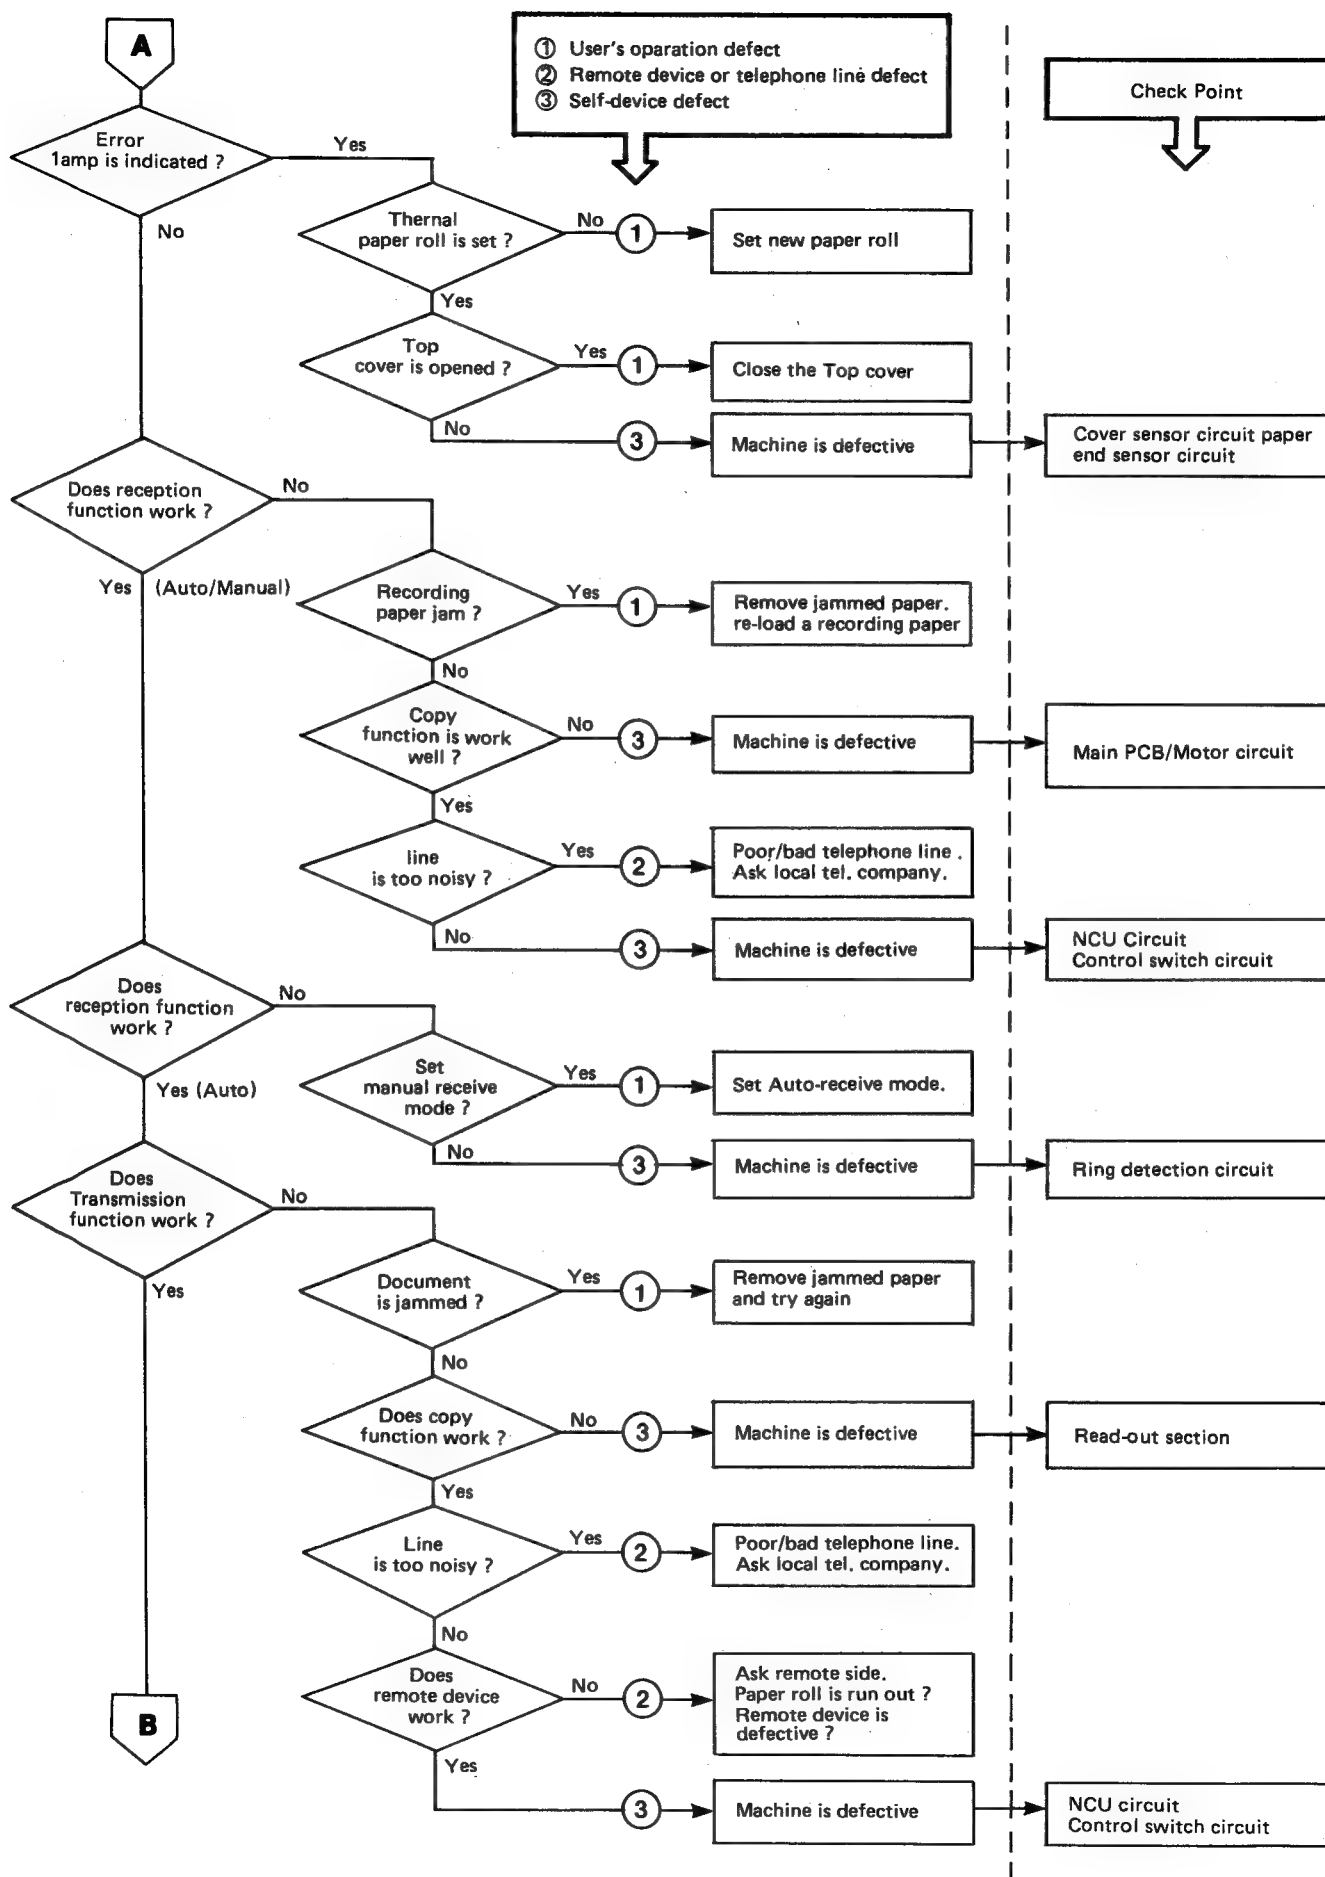

- (1) A malfunction resulting from the way the user has used the unit.
- (2) A malfunction resulting from a problem of the other unit or of the telephone circuit.
- (3) A malfunction resulting from a problem of this unit.

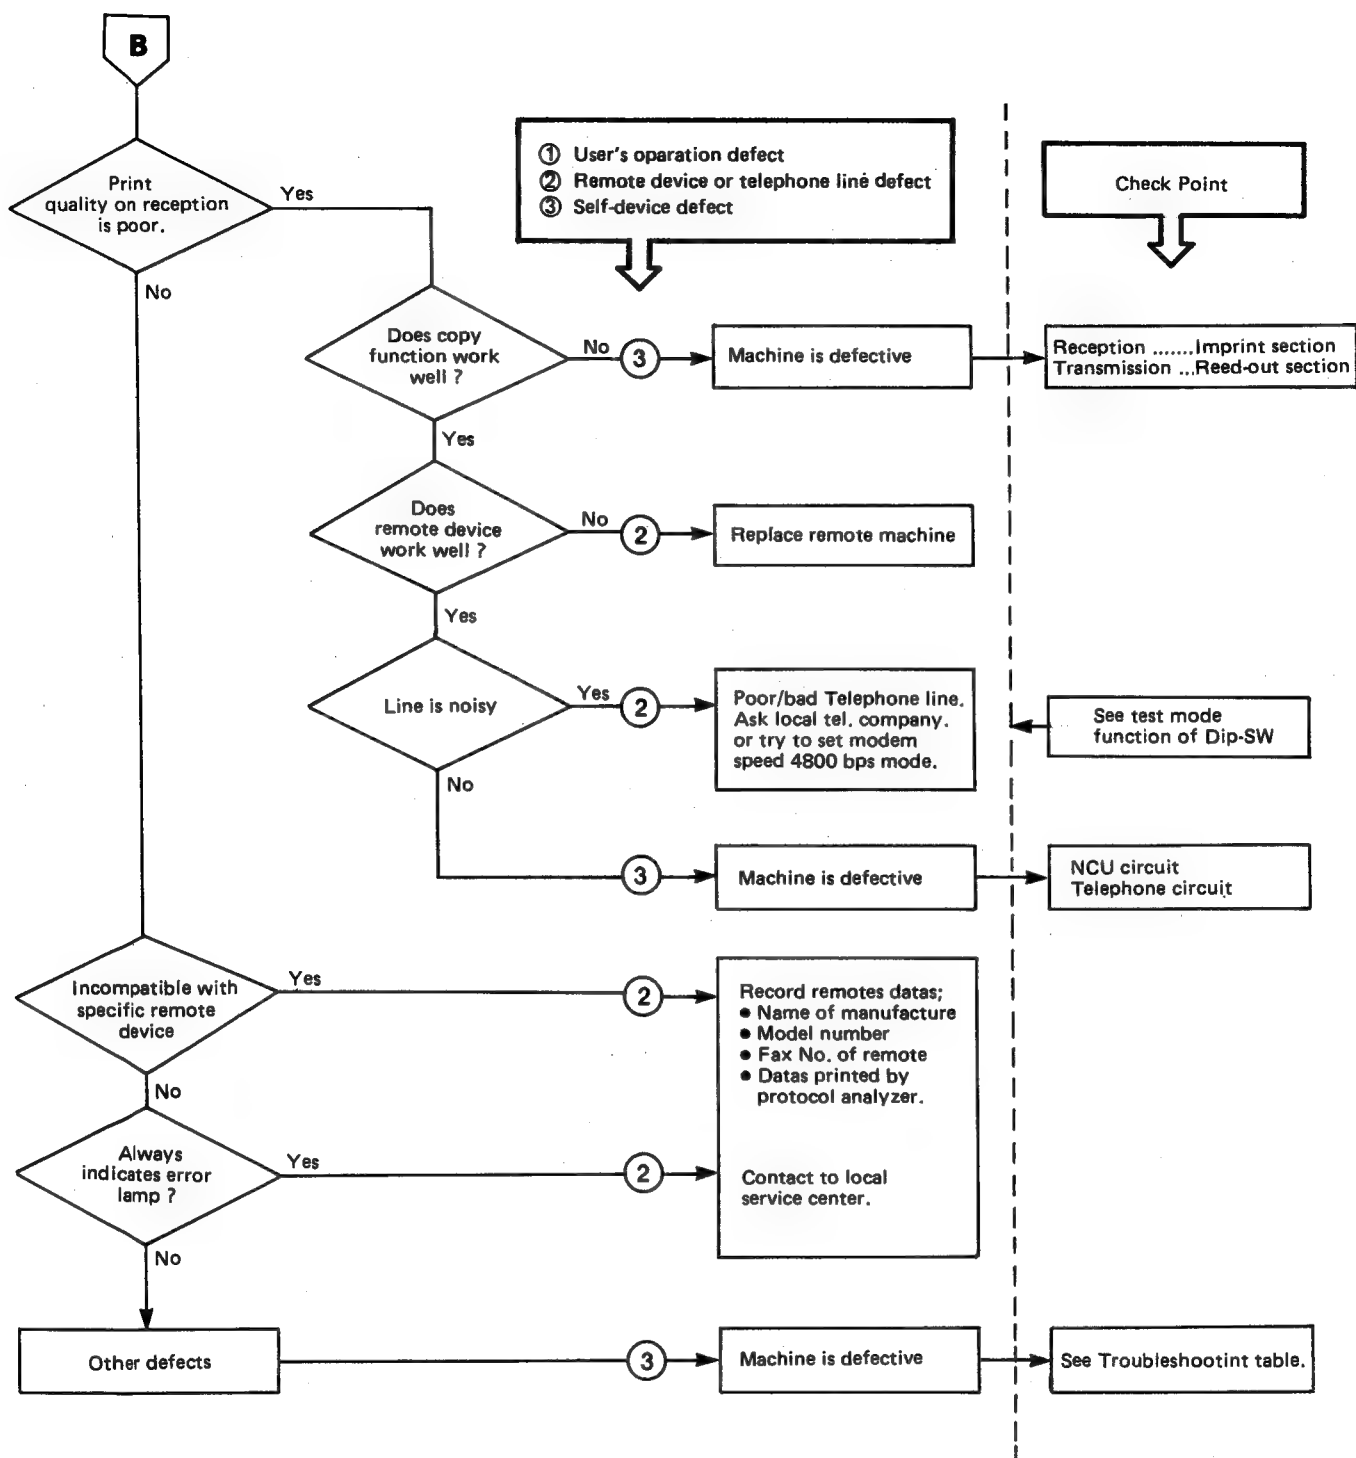

Refer to the "TROUBLESHOOTING FLOW DIAGRAM" (in a subsequent section) to classify problems into one of the three classifications described above.

If the problem is diagnosed as a malfunction resulting from a problem of this unit, refer to the "Troubleshooting Table". For models with the liquid-crystal display, check the error code displayed on the liquid-crystal display, and then refer to the "Error Code Table".

1) TROUBLESHOOTING FLOW DIAGRAM

2) TROUBLESHOOTING TABLE

	Description of defect	Probable cause	Suggested remedy
1	No power	1) Defective power supply unit.	Replace a power supply unit.
		2) Disconnection of primary and secondary connectors.	Connect the connector properly.
		3) Thermal protection circuit is activated (TH terminal). Temperature reaches over 80° C.	Check thermal protection circuit.
2	Malfunction when power is turned on. (LCD or LED indications are abnormal.)	1) Defective Main PCB and malfunction of MPU.	Replace Main PCB.
		2) Low power dc voltage due to defective power supply unit.	Check dc voltages on power supply. Replace a power supply unit.
3	Disconnection of line on transmission mode.	1) Improper transmit level	Check transmit level, and set the transmit level properly by using dip-sw on bottom of unit.
		2) Incompatibility/communication error	Contact with service center, inform datas; 1) Indicated error code: 2) Datas printed by protocol analyzer. 3) Model No. of remote machine. 4) Description of fault.
4	Print quality is poor on reception mode or transmission mode.	1) Telephone line is noisy.	Check with local telephone company.
		2) Machine connection location is too far distance from local telephone switching device.	Set pre-emphasis switch properly.
5	Dialing operation does not function properly	1) Dialing system is set improperly.	Set proper dialing system. pulse dial 10pps or 20pps. Tone dial (DTMF)
		2) Dial circuit is defective.	Replace a dial circuit.
6	Document is not taken in when placed for transmission.	1) Document sensor circuit is defective (sensor PCB, shutter lever of sensor etc).	Replace sensor PCB or defective components.
		2) Drive mechanism is defective. Such as motor, driving gears.	Replace defective components.
		3) Malfunction of the main PCB. (Motor drive circuit, Motor interface circuit etc.).	Replace the main PCB.
7	During the transmission, reception or copying operating, driving mechanism is noisy or emitting strange sound.	1) Motor (M1/M2) is defective.	Replace the motor.
		2) Gears are damaged on roller and motor ass'y.	Replace the roller ass'y motor ass'y.
		3) Main PCB ass'y is defective.	Replace the Main PCB ass'y.
		4) Wires ass'y with connector of the motor are defective.	Replace wires ass'y with connector of the motor.
8	Tel-line will not switch over to Fax on reception or transmission mode.	1) NCU circuit is defective. Such as loop current detection, relay, relay driver circuits.	Replace defective portion.
		2) Main PCB ass'y is defective. Such as interface circuits for loop current detection, relay and START switch.	Replace defective portion or main PCB.
		3) Start switch is defective.	Replace start switch PCB.
9	Transmission operation does not function when, in the transmission mode, telephone line switched over to Fax.	1) Modem unit is defective.	Replace the Modem unit.
		2) NCU circuit is defective. Wires ass'y, audio trans and amplifier etc.	Replace defective portion.
		3) Main PCB ass'y is defective. Modem interface, image datas processor portion etc.	Replace the main PCB ass'y.
		4) Image sensor unit is defective.	Replace the image sensor unit.

	Description of defect	Probable cause	Suggested remedy
10	Image datas errors on transmission mode. (In case of machine problem, not caused by line condition).	1) Modem unit is defective.	Replace the modem unit.
		2) NCU circuit is defective. Such as telephone line circuit and amplifier circuitry for transmission.	Replace the defective portion.
11	Paper end indication is always functioned.	1) Paper end sensor circuit is defective.	Re-align the paper end sensor circuit or replace paper end sensor circuit.
		2) Main PCB ass'y is defective. Interface circuit for paper and sensor.	Repair or replace the main PCB ass'y.
12	Auto-receive function does not work.	1) NCU circuit is defective. Ringer detection circuit.	Replace defective portion.
		2) Main PCB ass'y is defective. Interface circuit for ringer detection.	Repair or replace the main PCB ass'y.
13	Reception operation does not function when, in the reception mode, telephone line switched over to Fax.	1) Modem unit is defective.	Replace the modem unit.
		2) NCU circuit is defective. Such as telephone line, audio trans, amplifier for transmission and reception.	Replace the defective portion.
		3) Main PCB ass'y is defective. Interface circuit for modem.	Replace the main PCB ass'y.
14	Print quality is poor on reception mode. (Cause is not related to telephone line condition)	1) Modem unit is defective.	Replace the Modem unit.
		2) NCU section is defective. Mainly amplifier circuitry for reception.	Replace defective portion.
15	Copy Impressions are flawed, unclear vertical lines (white or black) appear on local copy mode on reception mode.	1) Thermal head tip dirty or otherwise contaminated.	Clean the thermal print head (See "cleaning" on page 4).
		2) Thermal head is defective . Impression element is dead.	Replace the thermal head.
		3) The wires connection for thermal head is defective.	Repair for wire connection.
		4) Main PCB is defective. Mainly strobe signal oscillator, interface circuit control IC for thermal head.	Replace the Main PCB.
		5) Image sensor block is defective.	Replace the image sensor unit.
16	During copying of data being received, horizontal lines appear and/or the impressions are deviated or irregular.	1) Driving mechanism is defective such as gear, roller and motor.	Replace defective portion.
		2) Main PCB ass'y is defective. Portions such as motor drive IC (IC3, IC4).	Replace the main PCB ass'y.
		3) Modem unit is defective.	Replace the modem unit.
17	Printed out letters is fading.	1) Are the setting of the dip-switch (DS3) correct?	See instruction of "Thermal head rank/DS3 setting table".
		2) Improper thermal paper is used.	Replace the thermal paper roll and use proper paper roll.
		3) Power supply voltages of thermal head is too low (+24V).	Replace the power supply unit.

3) TROUBLE OF ERROR CODE

3-1) OPERATION ERROR

CODE NO.	LCD INDICATION	DESCRIPTION
01	"OVER HEAT"	Temperature of power unit rises to 80° C (Approx.).
02	"HEAT TEMP. ERROR"	Temperature of thermal head rises to 70° C (Approx.).
03	"COVER OPEN"	Upper Cabinet is opened.
04	"DOCUMENT JAM"	During Transmission or copying mode, machine was interrupted due to limit 600mm length or Document Jamming.
05	"PAPER END"	No paper roll or paper end mark are appeared on copy, Transmission or stand-by mode.

* If code "01", "02" is appeared, auto-thermal protection will be functioned. Wait for a while with power switch off.

3-2) COMMUNICATION ERROR

CODE NO.	DESCRIPTION
10	Not used.
11	Not used.
12	Not used.
13	When transmit, receiving the Ending command from remote unit.
14	Disconnected during communication
15	Same as code 13.
16	Same as code 14.
17	After reception of DIS, Line was accidentally disconnected before sending DCS.
18	Line was accidentally disconnected during transmission of DCS.
19	Line was accidentally disconnected after transmission of DCS.
1A	Line was accidentally disconnected during sending training signal behind DCS.
1B	Coming DCN when waiting CFR or FTT after transmission of DCS + Training.
1C	Line was accidentally disconnected during reception CFR.
1D	Not used.
1E	Line was accidentally disconnected during transmission of Image data.
1F	Line was accidentally disconnected after transmission of Image data.
20	↑ Same as 1F code.
21	NOT USED.
22	↑ Same as 1F code.
23	Accidentally disconnected before transmission of EOP.
24	Accidentally disconnected during transmission of EOP.
25	Accidentally disconnected after transmission of Image data before transmission of PRI-EOM.
26	Accidentally disconnected during transmission of PRI-EOM.
27	Accidentally disconnected transmission of MPS.
28	Print quality is defective. (RTN)
29	Coming ending command from remote unit when sending post message after Image data.
2A	Print quality is defective. (PIN)
2B	CRP is transmitted from remote unit more than 3 times.
2C	Sending Post message command, but returned improper command from remote unit.
2D	After manuscript transmission, line was disconnected due to no response against post message command.

CODE NO.	DESCRIPTION
2E	Accidentally disconnected during reception confirming signal (MCF, RTP, RTN etc.).
2F	Not used.
30	Cover was opened after transmission of Image data and Line was disconnected before transmission of DCN.
31	Same as error code 29.
32	Coming DCN from remote unit after talk requested.
33	CKP is transmitted from remote unit more than 3 times after talk requested.
34	Same as 2C.
35	Same as 2D.
36	Accidentally disconnected after talk requested.
37	Accidentally disconnected after talk requested from remote unit.
38	Accidentally disconnected before the interrupt command (PRI-EOM etc.) for the talk request from remote unit.
39	Accidentally disconnected during setting transmit mode on transmission mode.
3A	Line was accidentally disconnected right after reception.
3B	Line was accidentally disconnected right after CED transmitted.
3C	Accidentally disconnected during or before transmission of CSI, DIS.
3D	During waiting for next document, does not be transmitted next document from remote unit.
3E	Disconnected when no response from remote unit in spite of sending DIS, T1 time elapsed on reception mode.
3F	Sending DIS, but receives DIS (improper command) from remote unit.
40	Sending DIS, but receives CRF (improper command) from remote unit.
41	Sending DIS, but receives FTT (improper command) from remote unit.
42	Sending DIS, but receives EOM (improper command) from remote unit.
43	Sending DIS, but receives MPS (improper command) from remote unit.
44	Sending DIS, but receives EOP (improper command) from remote unit.
45	Sending DIS, but receives PRI-EOM (improper command) from remote unit.
46	Sending DIS, but receives PRI-MPS (improper command) from remote unit.
47	Sending DIS, but receives PRI-EOP (improper command) from remote unit.
48	Sending DIS, but receives MCF (improper command) from remote unit.
49	Sending DIS, but receives RTP (improper command) from remote unit.
4A	Sending DIS, but receives RTN (improper command) from remote unit.
4B	Sending DIS, but receives PIP (improper command) from remote unit.
4C	Sending DIS, but receives PIN (improper command) from remote unit.
4D	Telephone line was accidentally disconnected during reception of DCS or GC.
4E	Telephone line was accidentally disconnected during transmission of GI.
4F	Telephone line was accidentally disconnected after recognition for compatibility of both parties.
50	Telephone line was accidentally disconnected after checking of TCF.

CODE NO.	DESCRIPTION
51	Telephone line was accidentally disconnected during transmission of FTT or CFR.
52	Receives DCN on beginning of receive mode.
53	Receives improper command after sending CFR or FTT. Then disconnected the line.
54	Does not receive commands or Image signal after transmission of CFR or FTT.
55	Telephone line was accidentally disconnected during stand-by of DCS after recognition of TCF signal-NG.
56	Responding to MPS but line is disconnected at remote unit.
57	Same as 8D but PIP signal.
58	Not used.
59	Not used.
5A	Same as 54.
5B	Telephone line was accidentally disconnected during reception of Image datas.
5C	Telephone line was accidentally disconnected after reception of MPS.
5D	After reception of Image datas, telephone line was accidentally disconnected during transmission of PIP.
5E	After reception of Image datas, telephone line was accidentally disconnected during transmission of RTP.
5F	NOT USED.
60	Telephone line was accidentally disconnected after reception of talk request from remote unit.
61	Same as 60.
62	Receives talk request from remote, line was accidentally disconnected during transmission of PIP.
63	Same as 3D.
64	Receives improper command from remote unit.
65	Not used.
66	Not used.
67	Line was accidentally disconnected during transmission of G2 phase signal.
68	Same as 67.
69	On transmitting of G2 mode, remote machine was not ready to receive.
6A	Line was accidentally disconnected during reception of tonal CFR.
6B	After receiving the MCF, not receive GI 2, transmitting the PIS after T1 time elapsed, disconnected the line.
6C	Not used.
6D	Not used.
6E	Line was accidentally disconnected during transmission of Image data on G2 mode.
6F	Not used.
70	Same as 6E.
71	Line was accidentally disconnected during transmission of EOM on G2 mode.
72	Receives no response signal after transmission of manuscript on G2 TX-mode.
73	Line was accidentally disconnected during reception of tonal MCF on G2 mode.
74	Sending PIS signal after T2 time elapsed due to receive improper signal or receive none signal after transmission of EOM.
75	Same as 73.

CODE NO.	DESCRIPTION
76	Not used.
77	Line was accidentally disconnected during transmission of PIS.
78	After transmission of tonal GI, line was accidentally disconnected during reception of GC.
79	Line was accidentally disconnected during reception of GC.
7A	Line is disconnected during G2 communication.
7B	Not receive the training signal before reception of manuscript on G2-RX mode.
7C	Line was accidentally disconnected during reception of phase signal on G2 mode.
7D	Same as 7A.
7E	Line was accidentally disconnected during transmission of CFR signal on G2 mode.
7F	On reception mode, Image picture signal is interrupted or receives the signal other than EOM at end of document data.
80	Receives no command after completion of reception on G2 mode.
81	Line was accidentally disconnected during reception of Image datas on G2 mode.
82	Not used.
83	Line was accidentally disconnected during transmission of MCF on G2 mode.
84	Line was accidentally disconnected during reception of GC on G2 mode.
85	STOP KEY is pressed during communication.
86	On reception mode, remote unit is also reception mode.
87	After receiving DIS, sending DCS + TCF 3 times then disconnected the line.
88	Receives DTC (as response) or DIS after transmission of DCS + TCF, then disconnected the line after repeating the DCS + TCF 3 times.
89	Receives improper command after sending DCS + TCF, then disconnected the line.
8A	Exceeding the one sheet transmission time of 8 minutes.
8B	On reception mode, after receiving RTC, or Image data is interrupted, not receive the post message command, sending DCN after T2 time elapsed.
8C	On reception mode, line is disconnected due to receive improper command after Image datas.
8D	Sending response signal after receiving post message command, then receives improper command and disconnected the line.
8E	Sending response signal (RTP) after receiving post message command, no receive the command within the period of T2 time.
8F	Not used.
90	Receives no response command within the T1 time on transmission mode.
91	Receives improper response command (other than CFR) after sending the phase signal on transmission mode.
92	Polling function is not available against requested by remote unit.
93	Transmitting in Fine or Half tone mode, could not send due to the remote unit is G2 machine. Line is disconnected after T1 time elapsed.
94	Line is busy when Auto dialing call.
95	Line is disconnected during Auto dialing process.

9. TRANSMISSION TERMINAL ID REGISTRATION

POSTAL REGULATION FOR WEST GERMANY

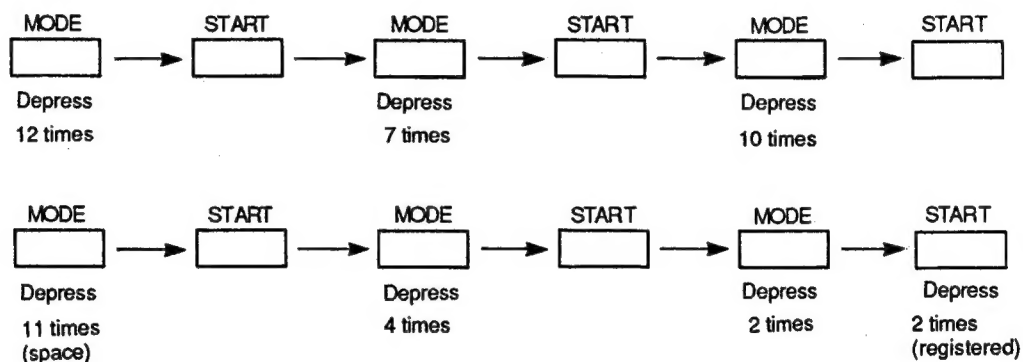

The input of ID (Sender's phone number) must be performed by installing technician. If the machine (after moving etc.) is connected to a different line, contact the authorised service to carry out the change of the number.

ID REGISTRATION PROCEDURE (PFX5800 EUROPEAN VERSION ONLY)

A. To register the ID

1. Turn on the Back up Batt. Switch (See page 14) on the bottom of the unit.
2. Set Test 1 and Test 2 (See page 14) switches to ON position.
3. Turn power ON with the MODE button is depressed.
4. Register the phone number as the ID (20 digits max.) by depressing the MODE button and START button as figured.

Example: +70 42

ID number will be printed out on the recording paper after registered the ID.

5. Turn the power OFF.
6. Test 1 and Test 2 Switches to OFF position
7. Turn the power ON again to return to the ready state.

B. To print out the ID registered

1. Test 1 and Test 2 switches to ON position.
2. Turn power ON with the TALK button is depressed.
3. The registered ID will be printed out.
4. Proceed step 5 to 7 of item A.
